TITLE OF THE INVENTION

METHOD FOR FACILITATING PRICING, SALE AND DISTRIBUTION OF FUEL TO A CUSTOMER

COMPUTER SOFTWARE ADDENDUM

Attached hereto is a compact disc containing computer software and data including executable programs, scripts, and database management system tables that are used to implement the systems and methods provided by the present invention. More particularly, the attached compact disc contains software and data used to implement at least two distinct applications comprising the systems and methods provided by the present invention; such two distinct applications include a broad-based, general use energy management system (referred to as the Energy Management System "EMS"), and a limited user/function restricted application (referred to as the Producer Control Center "PCC") intended for use by fuel producers needing access to centrally stored and managed fuel deal data. Such material is protected by the Copyright Laws of the United States (17 U.S.C. § 101, et seq.) and may not be copied without the express, written authorization of the copyright holder Copyright © 2001, Highland Energy (Highland Energy Corporation). Corporation. All Rights Reserved.

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates to systems and methods used to facilitate pricing, sale, and distribution of fuel to a customer. More particularly, the present invention is directed to automated systems and methods that are used to price fuels such as natural gas, oil, gas, other petroleum based fuels, etc., to facilitate commodity sales of such fuels, and to distribute such fuels to customers, and to track and report sales and distribution related data.

Description of the Related Art

Fuel sales and distribution systems and techniques are well known. Everyday millions of fuel sale contracts are completed in the U.S. and abroad. Fuels produced by a range of producers are transported over many modes of transportation (e.g., gas pipelines, etc.) to ultimately arrive at an intended destination. The steps involved in pricing fuel, selling a reserve, storing reserves, and ultimately transporting purchased fuel involve many parties including producers, agents, brokers, other middlemen and, ultimately, end customers. All of these parties have their own unique ways of doing business, reporting sale and purchase data, and collecting and paying against agreed upon contracts.

Unfortunately, many of the steps and processes carried out to facilitate fuel sales and distribution are archaic, inefficient, and, often, paper-based. Such inefficient ways of doing business cause many parties to engage large teams of personnel to manage the intricate details often involved in fuel sale and distribution. Fuel deal pricing provides a good example of the inefficiencies involved in moving large volumes of natural gas and other fuels.

Typically, pricing fuel deals in the natural gas arena involves manual processes related to gathering fuel index rates, manually computing sales prices across a multitude of fuel sales deals, laboriously factoring in transportation and other tangential costs, and managing for fuel overages and short falls often associated with transportation anomalies, etc. These processes typically involve the efforts of large teams of personnel within organizations who are required to constantly monitor sales deals, set pricing limits for sales people, and track and record fuel deal progress.

While many systems have been developed to facilitate sale and distribution of fuel and other products, commodities, and services in general, no systems developed to date can effectively management the volume of transactions among a wide array of parties to efficiently and effectively get fuel from one place to another. Moreover, existing systems have heretofore not been able to facilitate pricing practices that factor in past fuel deal data across a

10

15

20

25

30

multitude of prior fuel deals to better drive profit margins in the commodities and brokerage fields.

Accordingly, there exists a serious need to provide systems and methods that enable centralized location and management of fuel deal data, provide for application of pre-determined pricing techniques based on such fuel deal data, facilitate broad-based reporting based on such centrally stored fuel deal data to drive better business practices for parties to fuel deals, and increase productivity and make more efficient fuel sale and distribution practices. The present invention squarely addresses such a need and provides a new and improved systems and methods for facilitating fuel sale and distribution.

SUMMARY OF THE INVENTION

The present invention solves the problems mentioned above with regard to prior systems and methods used to facilitate sale and distribution of fuel to a customer. By squarely addressing the limitations of prior systems and methods, the present invention provides new and improved systems and methods that permit a wide array of users to broadly access a central data store to create and manage fuel deal data. Such new and improved systems and methods further permit the inclusion of pricing processes into existing business processes that are based on prior fuel deal data and which take into account prior prices charged across collections of prior fuel deal contracts.

Accordingly, the present invention provides new and improved systems and methods for facilitating sale and distribution of fuel to a fuel customer. Such systems and methods include and involve a server facility configured to store fuel deal data and to process such fuel deal data to automatically generate pricing data based on the fuel deal data and in accordance with a predetermined pricing technique. The system and method also include and involve a client facility that is coupled to the server facility via an electronic data network and which is configured to permit a user to enter such fuel deal data and to cause the server facility to store and process the fuel deal data to generate the pricing data. As such, fuel may be sold and distributed to a fuel customer via a

fuel distribution system based on the fuel deal data and the automatically generated pricing data.

BRIEF DESCRIPTION OF THE DRAWINGS

5

The present invention is described in detail below with reference to the following drawing figures, of which:

FIG. 1 is a timing diagram that depicts process flows within a business process that facilitates sale and distribution of fuel to customers in accordance with a preferred embodiment of the present invention;

10

FIG. 2 is a system diagram in which client systems can access server system(s) to facilitate sale and distribution of fuel to customers in accordance with the business process illustrated in FIG. 1;

15

FIG. 3A is an entity relationship diagram that depicts data relationships among tables and corresponding table entries used to implement the systems that carry out the business process illustrated in FIG. 1;

relationships among tables and corresponding table entries used to implement the systems that carry out the business process illustrated in FIG. 1;

FIG. 3B is another entity relationship diagram that depicts data

20

FIG. 3C is another entity relationship diagram that depicts data relationships among tables and corresponding table entries used to implement the systems that carry out the business process illustrated in FIG. 1;

FIG. 3D is another entity relationship diagram that depicts data relationships among tables and corresponding table entries used to implement the systems that carry out the business process illustrated in FIG. 1;

25

FIG. 3E is another entity relationship diagram that depicts data relationships among tables and corresponding table entries used to implement the systems that carry out the business process illustrated in FIG. 1;

30

FIG. 4M is another screen shot of a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1;

FIG. 4N is another screen shot of a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1;

FIG. 4O is another screen shot of a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1;

FIG. 4P is another screen shot of a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1;

FIG. 4Q is another screen shot of a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1;

FIG. 5A is a flow chart that illustrates the operations carried out to effect a pricing technique and, in particular, one that effectuates a weighted average sales price for fuel deals in accordance with a preferred embodiment of present invention; and

FIG. 5B is the conclusion of the flowchart started in FIG. 5A.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention is now described in detail with regard to the drawing figures that were briefly described above.

The systems and methods described herein are illustrative of the exemplary system implemented by way of computer software within a networked data processing environment and which is contained within multiple files housed on the compact disc that is appended to this patent document. Accordingly, the discussion that follows refers to such an exemplary system and those skilled in the art are encouraged to review such appended software in the context of fuel

10

15

20

25

30

deal management for a complete understanding of the present invention. As noted at the beginning of this patent document, the material contained on the attached compact disc is protected by the Copyright Laws of the United States (17 U.S.C. § 101, et seq.) and may not be copied without the express, written authorization of the copyright holder (Highland Energy Corporation). Copyright © 2001, Highland Energy Corporation. All Rights Reserved.

Referring now to FIG. 1, depicted therein is a timing diagram corresponding to the business process carried out within an organization to facilitate sale and distribution of fuel to a customer and which may be set up to utilize the systems and methods provided by the present invention. In particular, FIG. 1, illustrates a monthly or periodic business process involving several phases of operation that are carried out by the systems and methods provided by the present invention including, but not limited to: an availability phase, a bidding phase, a nominating (e.g., gas pipeline nominations, etc.) and routing phase, a third party and sanctioned sales period, a pricing period, an invoicing period, and an accounting period. Together, these periods make up what is referred to herein as a MONTH OF FLOW PROCESS (MFP). The MFP is described next to further illustrate the business operations that are handled by the systems and methods provided by the present invention.

THE MONTH OF FLOW PROCESS (MFP) Availability Period

During the availability period of the month of flow process, equity contracts for sale and distribution of fuel (those that need to roll from month to month) are established for the next month. These purchase deals define the anticipated volumes by well/meter for each producer. The status for the production month needs are set to 'Availability' at this point. Then, correspondence is transferred (via fax, email and phone conversations) to the various operators/producers in order to confirm the anticipated volumes to be produced.

10

15

20

25

30

The anticipated production volume for an entire well/meter is then entered into the system. An entitlement and makeup percentage is used to indicate how much of this volume is actually available to be marketed (represents the owner interest in the production of the well/meter). New deals are setup on the system to represent the new month's purchases. The package description is utilized to assist with easy recognition of volumes, price, etc. (used for identification purposes only). There is a process built within the system to automate the propagation of new deals to the next month (first time into a new month will automatically generate entries for the new month with zero volume amounts). The actual volume stored on the system (at this point) is zero. Only the nominated volumes contain the expected volumes for the production month. These 'nominated" volumes are equal to the estimates provided by the producers and entered into the system during this part of the month of flow. The primary area of the system utilized is the 'Availability' functions (off the system's main menu.)

Bid Week Period

During the bid week of the month of flow process, buyers are found for the volumes that were made available through the availability step described above. The status of the production month of the system needs is set to 'Sales' at this point. By setting the status to 'Sales' all of the price indices will be initially populated and 'seeded' with zero values. Each of the sales is confirmed by a dealmaker and is written up on a deal log sheet. These deal log sheets reflect the pipe/field, meter/well, company, contract, volume, and pricing instructions to support the sale. Prior to completing a deal, the dealmaker will work closely with the volume control group to ensure that appropriate volumes will be available at the well/meter of sale. The dealmakers then complete the deal log sheet entries for the sale and they are transferred to the volume control group for deal creation and entry into the system. Most of the volumes sold during this particular phase are for the equity purchase deals created during the availability period.

Nominating and Routing

During the nominating and routing period of the month of flow process, the volumes to support the sales are routed from the producer's well/meters to the sales wells/meters (primarily to pooling points or field tanks). This process occurs throughout the entire month. When the volumes are routed to specific pool wells/meters, allowances are automatically made by the system for fuel, gathering and transport costs. These costs will net down the actual available volumes that can be applied to the sales deals. When volumes are routed to a pool/tank then these volumes reflect as 'Transport Out volumes'. The volumes then show up as "Transported In' (net fuel) on the receiving meter/well within the system. The primary area with the System utilized during this process is the "Route Volume" menu option within the Routing module (main menu selection of 'Routing' on the System.

15

20

25

30

10

5

Third Party Deals and Sanctioned Sales

During the Third Party Deals and Sanctioned Sales of the month of flow process, the dealmakers complete the third party deals. These deals are typically setup where a specific purchase deal (non equity type) is made to support a specific sales deal. These types of deals will usually have a specific price agreement and volume associated with them. Sanctioned sales represent sales from equity volumes with specific terms (prices, volumes, etc.) to specific sales meters. A sales price for a specific volume is set in advance of the production month with these types of deals. All third party deals are excluded from Weighted Average Sales Price (WASP) calculations as discussed below with regard to FIGS. 5A and 5B (each third party purchase volume exists within its own WASP pool ('None')). All sanction sales deals are included within the WASP calculation but EACH combination sanction sales (purchase-to-sale) will utilize a 'Dedicated' WASP pool during the calculation. In this way, sanction sale costs etc. PLUS netback percentages can be applied. All equity deals combined with the 'Common' WASP pool where costs and prices are

aggregated by meter/well based on volume weightings. All deals actually go through the calculation in order determine margins. However, the calculation has been setup to ensure that third party, sanctioned sale and equity pools are calculated without interfering with each other.

5

10

15

Pricing

During the pricing period of the month of flow process, all monthly index based prices are entered immediately when published. These are usually entered just before the beginning of the production month. Daily prices are keyed or otherwise entered throughout the month as they are received. When deals are setup the 'Pricing' function within the System is used to actually calculate a price for the deal ('Price' tab on deal detail screen). Each evening, for example, the 'Price All Deals' function of the System is started. particular function will re-price all deals for the entire month (Price + WASP calculations). For months in the 'Sales' phase, the nominations are re-priced and recalculated. For months in the 'invoiced' phase, the pipe/field actuals are re-priced and recalculated. In addition, to this periodic process, an option exists within the System to price production months throughout a day, for example. Below, with reference to FIGS. 5A and 5B, the details related to fuel deal pricing are described. The ability of the present invention to incorporate a pricing technique such as one that is predetermined and implemented as a modular component of a larger software system, represents a significant point of novelty to which the present invention is directed.

25

30

20

Invoicing

During the invoicing period of the month of flow process, invoices for all of the sales for the previous month are produced. This represents the final step of the month within the system. All marketing individuals directly involved with the system for the month (controllers, dealmakers, etc.) are informed that the month is closing out and that invoices are now being produced. The status for the production month is changed to 'Invoiced'. A final nomination calculation is

10

15

20

automatically done with the status updated. Accounting is then notified that the month has been completed. Invoicing reports are then run for the month and sent to the buyers by an accounting group, for example. Additional reports may be run (Sales By Pipe/Field, Purchase By Producer, Balancing Reports, Pipeline Statement Comparison Reports, etc.) by the accounting group for historical reference and reconciliation.

Accounting

During the accounting period of the month of flow process, an accounting group creates a revenue and journal entry feed to track receivables within an automated accounting system. This feed is created directly out of the system. Pipe/Field statements begin appearing beginning as early as the 15th of the month. These statements represent volumes (by well/meter) for the previous month. Each accounting analyst is responsible for a specific set of pipe/fields. The volumes from these statements are entered as actuals into the system. A copy of the Pipe/Field statements are sent to the controllers for sign off. Accounting analysts then balance all of the purchase meter routing information for their respective pipe/fields. Accounting analysts then balance all of the sales meters for their respective pipe/fields. Accounting analysts then adjust any route volumes that cross pipe/fields to ensure interconnect balances are synchronized with pipe/field statements. Reconciliation and voucher reports can be run immediately after the production month is promoted to 'Accounting' phase (meaning accounting is finished with the month). These reports can then be sent to producers and/or entered into to accounting system.

25

30

AN EXEMPLARY SYSTEM

Referring now to FIG. 2, depicted therein is a diagram of an exemplary system in which client systems can access server system(s) to facilitate sale and distribution of fuel to customers in accordance with the business process (MFP) illustrated in FIG. 1. In particular, system 100 includes both server(s) 102 and client systems 104. Additionally, a database management system and

10

15

20

25

30

corresponding data store 106 (hereinafter data store 106) is used to store fuel deal data and programs. Servers 102 are configured to be accessed via wide area network connections such as those facilitated via the Internet using open standards based protocols. Client systems 106 are configured with software contained on the appended compact disc to access servers 102 to engage in fuel deal operations such as those described with reference to the month of flow process (MFP) discussed above with regard to FIG. 1.

In FIG. 2, client systems 104 may be configured as desktop computing systems, wireless computing clients, etc. to access servers 102. Such access may be made possible via applications and technology such as dbOvernet TCP/IP Socket Connection Middleware. Furthermore, servers 102 execute common SEServer applications and routines utilizing dbOvernet middleware technology.

Within the processing space of servers 102, a database server system such as Microsoft's SQLServer V.7.03 (a DBMS engine) may be instantiated. Such a database management system may control data store 106 and may be configured in accordance with the present invention to maintain all fuel deal data in accordance with the present invention.

The following discussion further defines an exemplary arrangement for a client-server system implemented in accordance with the present invention:

SERVERS

MS Windows NT 4.0 (SP6) may be chosen as a Network Operating System.

The DBMS may be Microsoft's SQL-Server (V7.0x) – Service Pack 3. All data generated and processed within the context of the present invention is stored in MS SQL-Server database tables. Such data is accessed via direct SQL statements (embedded in Windows applications, stored procedures, forms, and reports). There are several database views that have been setup to access aggregated information (for performance and consistency). In addition, all of the critical calculations and time consuming procedures such as pricing

10

15

20

25

30

calculations, routing and rollover processes, etc. are written as Transact-SQL stored procedures and are contained on the attached compact disc and are discussed in further detail below in the embedded description-tables found herein.

The SEServer may be a Middleware Server Application. The system database is accessed via middleware software that uses TCP/IP (SEServer/dbOvernet). All databases queried through the system come through this middleware component.

SECrystal (Crystal Reporting Engine Server Application) may be used for server side reporting functions, etc. All reports for the system utilizes a remote Crystal Reporting engine (SECrystal) server. These reports are run and saved on the server for electronic distribution. Crystal Report (V8.0) from Seagate Software is used for this function.

The SEFax (Fax Server Application) may be used for Fax distribution. This server application is responsible for sending out reports via a fax device. This software monitors a specific directory and when a fax file 'shows up' in the directory it will be faxed.

The MAPI Mail Client Software provides Email (like Microsoft Outlook or Outlook Express). The MAPI compliant email service needs to be running on the same machine as the report engine server (SECrystal). This provides the ability to email reports (Correspondence) automatically. Options should be set on this client to automatically check (send/receive) at periodic intervals.

The Adobe Acrobat Reader (Free PDF Viewer) is used to view reports, etc. The server machine that runs the SECrystal reporting server application needs to also have the PDF viewer installed. This is used in order to 'spool' to paper the print jobs.

WEB ACCESS - NETWORK CONNECTIVITY

All functions within the System are available over the Internet (with appropriate security). An individual wishing to log in to the system over the Internet will need to have appropriate application security to log in, the current

application executable program (as contained on the attached compact disc) and an ISP account. System administrators will need to furnish access site addresses (e.g., IP addresses, domain names, etc.) to users to address the systems provided by the present invention.

5

10

15

20

25

CLIENT SYSTEMS

Client systems may utilize a Client Operating System such as MS-Windows 95/98/Me; MS-Windows NT 4.0/2000. TCP/IP network protocol is required. Access to the server TCP/IP address (either LOCAL address or REMOTE address is required.)

The system typically includes a single .EXE file(s) (plus approximately 8 disk compression and graphics DLL's). The system application require only a single executable with a few DLL's to reside on the client machine. No other client configuration software is required. Upgrades to the client software are automatically done when a user first connects (logs in) through the Internet (on application startup). A version number check will be made if necessary and a new installation program and script are automatically downloaded.

The Adobe Acrobat Reader (FREE PDF view) is used as a reporting system for files saved in the PDF 1.2 format. The default output for all reports on the system is the standard PDF format. This provides for email/electronic storage. In order to view reports this software (or other third party viewer with a file association to .pdf files) needs to exist on the client machine.

The MAPI Mail Client Software is used for electronic mail communications. A MAPI compliant email service needs to be running on the client machine to be able to highlight a report and email it using the client email address list. This software is not required to run the but is required to take advantage of the system's ability to attach reports automatically within an email client.

All client applications are written using DELPHI (V5+) including Delphi 3rd party tools and procedures. Such applications and stored procedures and

identified 3rd party tools are further described in the description-tables found below.

DATABASES, AND CORRESPONDING ENTITY RELATIONSHIPS

5

10

The various database tables that make up the system have been divided into nine (9) database subject areas. A subject area within this context is simply a logical aggregation of tables that support a particular business or system function. All of the database tables physically reside in the same database, but are not required to so reside. Only the documentation (as described below) has been constructed to illustrate these subject areas. It is also important to note that there are linkages (not documented here) between the various subject areas.

These database subject areas and a description include:

15

Companies: All company related tables (including company name, contact name, addresses functions, etc.).

Contracts: All contract related tables (including contract provisions, notes, default standard reporting, etc.).

20

Deals: All deal related tables (includes other costs, deal classes, correspondence, etc.).

Volume Inventory: All volume inventory tables (includes production interests, daily monthly, calculated values, etc.).

25

Operational: All tables that were created to support the system (software application). These tables include fax queue tables, printer definition tables, system logs, system messages, reporting tables, etc.

Pipes/Fields: All pipe/field and meter/well related tables.

Pricing: All tables within the system that are related to pricing (indices, price descriptions, baskets, etc.).

30

Routing: All tables within the system that define routes (leg definitions, daily leg rates, monthly leg rates, nom and actual volume routing instructions, etc.).

Security: All security related tables within the system (includes user, logins, passwords, business functions, etc.).

The above-described nine (9) logical database subject areas are next broken down into the actual tables that reside on the attached compact disc. For purposes of brevity, such database subject areas are broken down in the following tables:

10

5

<THIS SPACE LEFT BLANK INTENTIONALLY>

TABLE DESCRIPTIONS

Below is an inventory of the various database tables that are utilized by the Energy Management System. This particular inventory indicates the current number of rows (through January 2001), the database (MS SQL Server) and the database subject areas (logical grouping of tables).

Ref#	Table Name	Rows	Database	Subject Area	Description/Comments
	Companies				
	Subject Area				
1.0	Address	1,384	SQL Server	Companies	Contains record entries for each address for all companies and contacts within companies (multiple address types per company and/or contact).
2.0	Company	1,242	SQL Server	Companies	Contains a record entry for each company in the database. Information on this table includes company name, fax, phone and primary address reference identifier.
3.0	Contact_Group	908	SQL Server	Companies	Contains a record entry for each contact group relationship. This is the mechanism for grouping company contact individuals
4.0	Contact_GroupNames	8	SQL Server	Companies	Contains a record entry for each contact group name.
5.0	ContactFunction	997	SQL Server	Companies	Contains a record entry showing the contact to function relationships for a given company.
6.0	Contacts	3,347	SQL Server	Companies	Contains a record entry for each individual contact in the database. Includes full name, phone, fax, email, title, etc.
	Contracts Subject Area		<u> </u>		
10.0	К	1,414	SQL Server	Contracts	This table contains a record entry for each contract within the system. Bank information (ABA), Evergreen indicators, termination date, fixed pncing, etc. type data attributes are stored on these records. Each contract on the system has an associated parent 'company' (on the Company table).
11.0	KNetBack	334	SQL Server	Contracts	This table contains the netback pricing tiers associated with a given contract. The parent table for this entity is the contract table (K). The netback pricing tiers are volume and date influenced.
12.0	Knotes	589	SQL Server	Contracts	This table contains an optional record entry for each contract on the system. If there are no notes associated with a contract then the records are not inserted on the database. This provides the users with a free form area for keeping notes about a contract.
13.0	Kproducts	1,049	SQL Server		This table contains a reference to the products that are available (oil, gas, liquids, etc.) for a given contract. A product has to be associated to a contract before a deal can be setup using that contract for that product.
14.0	KreportDefaults	48	SQL Server		This table contains the entire standard reporting defaults for a particular entity. These reports include invoices, remittance, vouchers, deal confirmations, etc.
15.0	KreportOverrides	-0-	SQL Server		If a particular contract has its own unique standard reports then a reference to these unique reports is stored in this table for the contract in question.

Ref#	Table Name	Rows	Database	Subject Area	Description/Comments
16.0	Kservices	1,068	SQL Server		This table contains a reference to the services that are available (marketing, end user, pass thru, etc.) for a given contract. A service has to be associated to a contract before a deal can be setup using that contract for that service.
	Deals		1		
	Subject Area				
20.0	RdealClass	6	SQL Server	Deals	This table is a reference table that indicates the types of deal class options that are available. The context of each class is 0=Purchases, 1≈Sales and 2=Both. The description field indicates the possible answers (but the rDealClassA table contains the actual answers that can be applied).
21.0	RdealClassA	23	SQL Server	Deals	This table is a reference table that indicates the possible deal classification options for each of the classifications defined in the rDealClass table.
22.0	RdealClassRules	448	SQL Server	Deals	This table contains record entries for every combination of deal classification answers (rDealClassA table). Each of these classification options can have its own set of calculation rules/etc associated with it.
23.0	Engine_Master	39,149	SQL Server	Deals	This table contains a record entry for each price entry effective date (header record).
24.0	Engine_MasterPrice	79,244	SQL Server	Deals	This particular table contains the individual pricing components associated to a given deal on a given effective date (parent record is on the Engine_Master table). When the user of the Energy Management System enters a price, this is the table that gets updated.
25.0	Package	65,351	SQL Server	Deals	This table contains a record for each deal that has been setup on the system. Start Date, End Date, Deal Name, Contract, Company, etc. are specified on this table.
26.0	PackageCosts	381	SQL Server	Deals	This table contains entries for all 'other costs' associated with a given deal. Each of these 'other costs' will have unique STID's (deal or meter level) and have calculated 'Engine' records automatically generated (when a calculation runs).
27.0	PackageCorrespondence	3,447	SQL Server	Deals	This table contains entries for all of the electronic correspondence between the parties to the deal (deal confirmations, availability reports, remittance detail, vouchers, etc.).
28.0	PriceComponents	19	SQL Server	Deals	This table contain record entries for each component that can be set aside for pricing purposes (on a deal). Examples include 'DAILY INDEX', 'MONTHLY INDEX', 'GATHERING', etc. These tags will be associated to each component of the price to allow for future queries and reporting. In addition, these tags will provide an audit trail of all pricing related information.
29.0	PriceDesc :	33,877	SQL Server	Deals	This table contains a record for each deal description (or comments) within the system. These price description records (only 1 per deal) provide the users with a place to put free form text to help describe the price of the deal.
	Volume inventory Subject Area	<u> </u>	<u> </u>		1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Ref#	Table Name	Rows	Database	Subject Area	Description/Comments
30.0	Engine	280,970	SQL Server	Volume Inventory	This table contains record entries for each calculated transaction that the system attaches to volume inventory items. Each transaction has a unique STID (transaction id) that are defined in the Engine_TransactionList table. Indicators on this table determine the disposition of the transaction.
31.0	Engine_TransactionList	36	SQL Server	Volume Inventory	This table contains record entries that define all of the transactions that can be calculated and stored in the Engine table. The STID field is the unique transaction identifier.
32.0	Gasinv	159,501	SQL Server	Volume Inventory	This is the primary table were all volumes (nominated and actual) are maintained. This table contains the header record entries that shows by month, company, transaction, pipe/field & meter/well the nominated volume and the estimated actual volumes. References to price types, contracts, etc. are stored on each record.
33.0	GasinvD	4,145,617	SQL Server	Volume Inventory	This table contains the detail (DAILY) nominated and estimated actual volumes for the Gasinv table.
34.0	Prodinterest	7,999	SQL Server	Volume Inventory	This table contains a record that lists the production interests that are held for a given meter/well and contract (with date effectiveness).
35.0	ProdPkg	4,080	SQL Server	Volume inventory	This table contains a record that indicates (by month) the contract and the deal ID of a deal that was generated automatically within the 'Availability' (equity purchase deal creation) area of the system.
36.0	ProdSum	39,296	SQL Server	Volume Inventory	This table contains records that indicate (by month and meter/well) the gross mmbtu's and the Btu factors.
37.0	ProdVol .	44,187	SQL Server	Volume Inventory	This table contains record entries (by month and meter/well) which show the receipt and delivery mmbtu's per day.
<u> </u>			<u> </u>		
	Operational Subject Area		· ·		and the second of the second o
40	ApplicationMessages	55,882	SQL Server	Operational	This table contains a 'rolling' 7 day listing of all application messages (such as those that are displayed to the console during a calculation).
41.0	ExceptionCategories	8	SQL Server	Operational	This table contains record entries to hold all of the exception 'reasons' that will be used whenever an exception even occurs. There can be multiple types of exception categories.
42.0	ExceptionList	2,171	SQL Server	Operational	This table contains entries for the actual exception events that get logged by the system. These represent an audit trail of non-normal or error type information. This table is linked to the ExceptionCategories table because each exception event (in this table) requires a reason category.
43.0	LogTable	4	SQL Server	Operational	This table is used for debugging purposes only and is not used in any screens or reports.
44.0	PrinterOef	6	SQL Server	Operational	This table contains a record for each available printer (including driver and port).

Ref #	Table Name	Rows	, 0ase	Subject Area	Description/Comments
45.0	RgasMonth	1,440	SQL Server	Operational	This is a reference table that contains a record for each month from 1/1980 thru 12/2099. In addition, this table also contains the status and status update sequence number for the particular month. This status is used in order to enable/disable certain functions within the Energy Management System throughout the month.
46.0	RGasMonthStatus	1,873	SQL Server	Operational	This represents a historical audit table that will be updated every time the monthly status for a given production month is modified (via triggers on the RgasMonth table). This provides a mechanism of identifying who & when the changes were for the status, over time.
47.0	SEMessages	1,251	SQL Server	Operational	All system messages are stored in this table.
48.0	SEAudit		SQL Server	Operational	This table contains record entries for those events that are deemed 'auditable'. Some examples include 'Login' events, Actualization balancing events, standard report submission events, etc.
49.0	SElmages	2	SQL Server	Operational	This table contains record entries that contain graphic images for the screen and reports used throughout the system.
50.0	SELocations	3	SQL Server	Operational	This table contains record entries that define the server paths (network folder locations) where certain key correspondence items are found. For example (report location, deal correspondence, etc).
51.0	SEProcessingCodeTypes	15	SQL Server	Operational	This table contains the 'Type' codes to the reference table 'SEProcessingCodes'. An example is the type code of 'CONTRCTPRD' which describes a reference code for contract products.
52.0	SEProcessing Codes	143	SQL Server	Operational	This table contains reference codes for various fields used throughout the Energy Management System.
53.0	SERptsExecutedStats	19,117	SQL Server	Operational	This table contains record entries that lists the start and end date and times for all reports that were submitted. This provides statistics on how long to execute/etc.
54.0	SERptsGroupItems	218	SQL Server	Operational	This table contains entries of each specific report that exists within a reporting tab (group) within a specific reporting folder (category).
55.0	SERptsGroups	36	SQL Server	Operational	This table contains a list of all available reporting tabs (groups) within each reporting folder (category).
56.0	SERptsitemDetail	123	SQL Server	Operational	This table contains the list of all available reports within the system.
57.0	SERptsitemParms	657	SQL Server	Operational	This table contains record entries for each report parameter for each report defined to the system. Options exist for substituting a different label name than actual parameter field name.
58.0	SERptsQueue	5,667	SQL Server	Operational	This table contains record entries for all submitted reports (report queue). When reports are automatically removed from the system the record is removed from this queue.
59.0	SERptsQueueDistribute	7,855	SQL Server	Operational	This table contains entries that dictate how to distribute the output of reports from the queue (fax, email, printer, etc.).
60.0	SERptsQueueNotify	276	SQL Server	Operational	This table contains entries that indicate who (and if) individuals or groups have been notif that the report has finished.
61.0	SERptsSchedule	0	SQL Server	Operational	This table contains records that define spe schedules for the running of scheduled re-

Ref#	Table Name.	Rows	Database	Subject. Area	Description/Comments
62.0	SERptsScheduledReports	0	SQL Server	Operational	This table contains record entries that define which reports to run as part of specific schedules.
63.0	SERptsScheduledGroups	0	SQL Server	Operational	This table contains 'groups' for scheduling. This provides the ability to assign multiple individuals to a specific group and have the group belong to the schedule.
64.0	SERptsScheduledUserGroup s	0	SQL Server	Operational	This is the actual table that contains the members within a schedule group. Each entry in this table defines the group.
65.0	SERptsTablesUsed	896	SQL Server	Operational	This table contains documentation on what tables, views or stored procedures are used within each report.
	Pipes & Fields Subject Area				
			<u> </u>		
80.0	Meter	4,335	SQL Server	Pipes and Fields	This table contains a record entry for each well/meter that has been setup on the system. The pipe/field, name, county and state are stored here.
81.0	MeterNotes	935	SQL Server	Pipes and Fields	This table contains a record for notes pertaining to meters/wells.
82.0	PipeField	372	SQL Server	Pipes and Fields	This table contains a record entry for each pip/field defined on the system. The company and the pipe/field description are stored here.
83.0	MeterRates	3,980	SQL Server	Pipes and Fields	This table contains the entire pressure base, Btu factors by effective date for specific meters/wells.
84.0	MeterAllocations	551	SQL Server	Pipes and Fields	This table contains entries for the allocation information on the meter/well. This includes accounting cross-reference codes (id and deck).
	Pricing Subject Area				
90.0	GCIndex	142,268	SQL Server	Pricing	This table contains record entries by Day for daily index prices AND/OR a single entry for monthly index prices (1st day of month for monthly indices).
91.0	IndexRef	228	SQL Server	Pricing	This represents the master table of all defined price indices within the Energy Management System. One record entry per index exists within this table.
92.0	IndexBaskets	14	SQL Server	Pricing	This table contains a record entry for each index basket established on the system. These index baskets can be associated to sales or purchase deals just as normal indexes are associated to them. Simple averages are calculated with all index items within an index basket.
93.0	IndexBasketLink	36	SQL Server	Pricing	This table contains the actual indices that are currently associated with an index basket. An unlimited number of indices can exist in a basket. A simple average of all the prices within the basket is used.
	Parting	• • • • • • • • • • • • • • • • • • • •		<u> </u>	
	Routing Subject Area	* " " * * * *	e de la company	<u> </u>	The state of the s
101.0	LegRef	4,226	SQL Server	Routing	This table contains record for each unique transportation leg (meter-to-meter) on the Energy Management System.

Ref#	Table Name	Rows	Database	Subject Area	Description/Comments
102.0	Leg	57,830	SQL Server	Routing	This table contains a record for each active leg within a given month. Nomination and actual rates that the leg-utilizes during the month are posted on each record. These rates are used with the actual routing instructions (LegDetail table).
103.0	LegD	0	SQL Server	Routing	This table contains OPTIONAL entries for any daily leg rates that need to be utilized within a given month. Daily rates are checked PRIOR to the monthly rates (on the Leg table) when setting up the actual routing instructions (LegDetail table).
104.0	LegDetail	1,716,695	SQL Server	Routing	This table contains the detail routing instructions for all volumes purchased all the way through the sales points for that particular volume. Nomination AND actual routing instructions are stored for each meter/well that had volume activity during the month. All volumes sold can be tracked back to originating purchase points.
105.0	WASPResovedRouting .	34,304	SQL Server	Routing	This table contains record entries that show the pool level calculated totals for all receipt and delivery points within the system. 'Common', 'Dedicated' and 'None' pools are aggregated and the total numbers stored here. Only 'Common' pool volumes and dollars represent the totals from more than one purchase point (shows weighted average pricing based on volumes purchased and/or transported).
	Security Subject Area				
110.0	GCUser	27	SQL Server	Security	This table contains a single record entry per unique user (employee) on the system. The character based (up to 12 character) login ID AND an internal user id (integer) are unique keys to this table.
111.0	GCButton	58	SQL Server	Security	This table contains records that represent the system functions that have specific security rules associated with them on the system. For example a system function of 'DEALS' has been setup in order to define security relationships between users (GCUser table) and this function.
112.0	GCSecurity .	1,548	SQL Server	Security	This table stores the relationships between users on the system (GCUser table) and the system function that they have access too (GCButton table). A specific access privilestored for each of these relationships (like READ ONLY, READ/UPDATE, READ/UPDATE)

Referring now to FIGS. 3A-3N, depicted therein are entity relationship diagrams that illustrate data relationships among tables and corresponding table entries used to implement the systems and methods that carry out the business process illustrated in FIG. 1. The database tables used logically categorized above into the above-identified nine (9) subject areas are maintained within data store 106 (FIG. 1), and are included among the files present on the attached compact disc, and are further defined in detail in FIGS. 3A-3N. Those skilled in the art will readily understand the data relationships among relational database tables as shown in FIGS. 3A-3N. Accordingly, for purposes of brevity, further comments about FIGS. 3A-3N have been omitted.

In addition to the tables described and specified in the tables listed above, the following table illustrates an inventory of the various database views that utilized by the systems and methods provided by the present invention.

15

20

<THIS SPACE LEFT BLANK INTENTIONALLY>

VIEW DESCRIPTIONS

Below is an inventory of the various database views that are utilized by the Energy Management System:

Ref#	View Name	Description/Comments
1.0	V_SearchDB	Provides a view to search the database stored procedures and triggers for specific text items.
		Used for assessing the impact of system changes.
2.0	VAccountingRevenueFeed	Database view (3 select UNION) used for creating OGSYS journal and revenue receivable data.
3.0	VCompany	Display of company information (name, address, etc.)
4.0	Vcontact_Accounting	Display the accounting contact for a given company.
5.0	Vcontact_Admin	Display the administrative contact for a given company.
6.0	Vcontact_Control	Display the control contact for a given company.

Ref#	View Name	Description/Comments:
7.0	Vcontact_Production	Display the production contact for a given company. This is the contact used for Availability estimates/etc.
8.0	Vcontact_volconfirm	Display the contact responsible for confirming volumes within a given company. This is the contact used for volume confirmations in the 'Availability' phase.
9.0	VcontactFunction	Display a list of all contacts for a given company along with their respective functions (accounting, volume confirmations, etc.)
10.0	VContacts	Display name and addresses for contacts.
11.0	VETID_Dates	Display the engine start, effective and end dates for a given engine transaction id (based on package). This view is used VERY LITTLE because of performance issues.
16.0	VgasinvD_NomChg	Display list of daily volumes where the nomination volumes are different between two successive days.
17.0	VKTermination	Displays specific contract termination information.
18.0	VlegDetail_MeterTotals	Display routing information summarized by meter.
19.0	VlegDetail_PipelineComparis on	Display routing information in a format that is used for the pipe/field comparison report. Used for reconciling fuel, gathering, transport, pvr, etc to pipe/field statements.
20.0	VlegDetail_PurchasePointTot als	Display routing information that shows total routing costs/etc for given purchase points (hop 0's).
21.0	VlegDetail_Summary	Displays routing information (summarized) for reporting purposes (purchase meters/wells only).
22.0	VlegDetail_SummarySales	Displays routing information (summarized) for reporting purposes (sales meters/wells only).
23.0	VMeterAllocations	This view is used to list the current meter/well allocations (based on effective date) for each given meter/well. These allocations are the accounting deck and purchaser id information, which can be different from month to month.
24.0	VMeterRates	This view is used to list the current meter/well rates (standard pressure base, pipe/field pressure base, Btu factor, etc.) for each given meter/well. These rates can be different from month to month.
25.0	VOurContact_Accting	Display the current HEC contact for accounting information.
26.0	VOurContact_Prod	Display the current HEC contact for production information.
27.0	VPackage_info	Display detail list of information concerning a package (includes contacts, names, phones, etc.).
28.0	VPrevGasMonthStuff	Displays current month volume totals versus previous month volume totals.
29.0	VprodConfirmLetters	Display contact information for use with correspondence on production volumes. Specifically used in the confirmation process in the 'Availability' production month phase.
30.0	Vprodinterest	Display a list of contracts and meters to confirm the production interests. This is used primarily in the 'Availability' production month phase.
31.0	VRequestProduction	Display list of production interest volume and meter information. This is used primarily in the 'Availability' production month phase and is used when sending out estimate reports to producers.

25

30

Once all software and data as described above has been properly installed on one or more server systems 102 and within one or more coupled (networked) client systems 104 as illustrated in FIG. 1, use and operation of the systems and methods provided by the present invention may be commenced. Such operations may be in relation to the general use application (Energy Management System - EMS) or the limited use/user/function application (Producer Control Console – PCC) provided on the attached compact disc. In either case, the present invention facilitates a client-server application environment that includes, among other things, a user interface that is pleasing to users and which permits easy and ready access to system functions and operations. Such a user interface may be a graphical user interface or GUI that is configured to permit a user to engage in window-operations to bring about database operations that affect fuel deal data and the like in accordance with the present invention. Such a GUI is illustrated by way of screen shots (images of computer monitor screens) that are used to permit generation of, manipulation of, reporting of, and all other system operations relating to fuel deals and corresponding fuel deal data.

For example, reference is now made to FIGS. 4A-4Q which illustrate a data processing application running within a client system to facilitate at least some of the operations carried out to effect the business process illustrated in FIG. 1. FIG. 1, for example, represents an opening main menu screen through which a user may select "PERSONAL" operations related to setting up a personal profile to affect user-preferred presentation of data (e.g., name, screen colors, etc.). Additionally, a user may select "PRICE-INDEX" to affect fuel pricing and index related data. A user may select "COMPANY" to control lists of producers, and other related company entities. A user may select other options corresponding to the steps involved and described with regard to the MONTH OF FLOW PROCESS illustrated and described with reference to FIG. 1.

The other screen shots shown in FIGS. 4B-4Q further illustrate specific features of the GUI that has been designed to facilitate the implementation of

the systems and methods provided by the present invention. For the purpose brevity, further detailed comments related to such screen shots has been omitted.

SYSTEM IMPLEMENTATION AND FUNCTIONALITY

As noted above, the present invention utilizes stored procedures in the form of database management system procedures and functions which are executed server-side and client-side to facilitate the present invention's systems and methods. Listed in the following tables, is a detailed break-down of all the stored procedures, tools, and modules used to facilitate such systems and methods. The actual source code and instructions contained with in such procedures, functions, and modules is contained on the attached compact disc.

STORED PROCEDURES

15

5

10

Below is an inventory of the various database-stored procedures (procedures and functions) that are utilized by the systems and methods provided by the present invention. Each of the stored procedures and functions are written in the Transact-SQL dialect. All of the stored procedures are prefixed with "usp_" which stands for "User Stored Procedure." This provides an ability to differentiate those procedures bundled with the DBMS versus those created for the systems and methods provided by the present invention:

STORED PROCEDURES

Below is an inventory of the various database-stored procedures (procedures and functions) that are utilized by the Energy Management System. Each of these stored procedures and functions are written in the Transact-SQL dialect. All of the stored procedures are prefixed with "usp_" which stands for "User Stored Procedure". This provides an ability to differentiate those bundled with the DBMS versus those specifically created for the EMS application.

Ref#	Stored Procedure Name	Description/Comments
1.0	Usp_DailyCleanup	This procedure is run everyday and is responsible for any cleanup activities (like rolling aged messages off the ApplicationMessages table).
2.0	Usp_fGetCalcIndex	Retrieves the weighted average price for a given volume item. This routine is invoked during the WASP calculation in order to obtain the price for the meter/well and post it to the Engine database table.
3.0	Usp_fGetIndex	Retrieves the daily or monthly price index for a given day. Used during the pricing calculation routine.
4.0	Usp_fGetIndexBasket	Retrieves and calculates the index amounts for the price lines whenever an index basket price variable has been entered. This particular function will return the average price (simple average) of all indices within the basket for a given month/day.
5.0	Usp_fGetNetbackPercentage	This function will return the actual netback percentage to be used for a given production month and contract. When it calculates the netback it looks at volumes and tier instructions that have been setup on the contract. The number it returns is the netback percentage to utilize. In addition, this routine brings back the specific percentage to use for the product being calculated (gas, liquids, oil, etc.).

Ref#	Stored Procedure Name	Description/Comments
6.0	Usp fGetProdinterestID	This routine brings back the production interest information for a particular
		ownership interest.
7.0	Usp_fGetProdPkg	This procedure brings back the 'deal id' (if one already exists) when posting
		volumes through the 'Availability' screens. If a deal does not already exist (in the
9.0	Han (CattAtA S Bladienter	current production month) then a new deal is created and that ID is sent back. This function accepts a deal id (package ID) as it's input. It then reads the
8.0	Usp_fGetWASPIndicator	DealClass table and the rDealClass table(s) to determine if this particular deal
		should be considered WASPable based on its classification scheme. The return
ĺ		values are either 'None', 'Common' or 'Dedicated'.
9.0	Usp_fGetWaspType	This procedure will send back the WASP type field (GAS, OIL or LIQUIDS) when
		passed a specific product ID. This procedure is used during the calculation in
	<u> </u>	order to determine which set of netback rules off a contract to use.
10.0	Usp_flsLastDay	This procedure accepts a date and sends back the last date in a production
44.0	11 - 0 - 10 - 1	month.
11.0	Usp_fLastDay	This procedure accepts a date and sends back the last date in a production month.
12.0	Usp fPipeContactInfo	This procedure, when passed a pipe/field id, will send back the specific contact
12.0	- DSP_1F1pecontaction	information requested (like accounting contact, volume contact, etc.).
13.0	Usp GasDayToGasMonth	This function will return the production month to use for a given production day.
14.0	Usp_GetProductVolumeRound	This routine will return the rounding precision necessary when calculating
	_	volume information for specify products (Oil calculates to 2 decimal places, Gas
	<u> </u>	to zero, etc.).
15.0	Usp_LinePrice	This is the actual procedure that will calculate the Engine records for a given
16.0	Usp_message	deal (volume related STID 8 or 9 type records). This routine handles all of the 'progress' messages that are issued during the
10.0	Osp_message	calculation, rollover, actualization, and etc. type events on the system. This
		routine will optionally post this information to the ApplicationMessages table for
		historical reference (audit).
17.0	Usp_pActualize_BaiPurchases	This is the main driver routine for Step 2 of 4 of the actualization process.
18.0	Usp_pActualize_BalPurchasesCheck	This routine will check to see if all of the meters/wells on a given pipe/field have
	<u> </u> -	been actualized. If not, then it sends back a bad return code. All meters/wells are required to be 'checked' (actualized) prior to balancing of purchase routing
		points
19.0	Usp_pActualize_BalPurchasesClear	This routine is the actual routine that will adjust all purchase meter imbalances.
10.0	1	These imbalances are adjusted forward THROUGH the sales point based on
		nomination routing instructions (used as a map).
20.0	Usp_pActualize_BalSales	This is the main driver routine for Step 3 of 4 of the actualization process.
21.0	Usp_pActualize_BalSalesCheck	This routine will check to see if all of the purchase meters/wells routing balances
		(from step 2 of 4) are balanced. If any meter/well on the pipe/field is out of balance then this routine sends back a bad return code. All meters/wells on the
		pipe/field are required to be 'balanced' prior to balancing of the sales points.
22.0	Usp_pActualize_BalSalesClear	This procedure is the final procedure invoked by the usp_pActualize_BalSales
		main driver procedure. It is responsible for posting imbalance amounts to the
		internal clearing purchase or sales deals.
23.0	Usp_pActualize_BalSalesOver	This procedure attempts to reconcile any outstanding balances that result in
. 1		OVER supplying of volume to a particular sale. Nomination information is used by this routine as a 'road map' on how to allocate this volume.
24.0	Usp_pActualize_BalSalesUnder	This procedure attempts to reconcile any outstanding balances that result in
27.0	- cab_hummaire_paicagiesoudei	UNDER supplying of volume to a particular sale. Nomination information is used
		by this routine as a 'road map' on how to allocate this volume.
25.0	Usp_pFillIndex	This procedure will initialize the records within the 'GCIndex' table with daily
	· 	entries (for daily indices) and monthly entries (for monthly indices). The monthly
		record entries are only on the first day of the month.
26.0	Usp_pFillIndexSingle	This procedure will populate the 'GCIndex' table with a price index entry for a
27.0	Lien nGaetnyD Fill	SINGLE index. This routine initially populates the daily volumes on the GasInvD table. These
21.0	Usp_pGasInvD_Fill	are initially populated with zeros (anytime a meter/well is added to a deal).
28.0	Usp_pGasInvD_NomEOM	This routine is used in the 'Availability' area of the EMS system and is used to
20.0		take a given volume amount and propagate that volume amount to all days in
_		the month.
29.0	Usp_LogAuditInfo	This routine is used to post record to the audit table within the system.
30.0	Usp_pPackageRevision	This routine is used to increment the revision number field on the deal. Certain
		types of changes to a deal will automatically increment the revision number on a
		deal and this update is done through this routine.

Ref#	Stored Procedure Name	Description/Comments
31.0	Usp_pPostClassificationRules	This procedure is executed (usually by triggers on the rDealClass and rDealClassA tables). It can be executed stand-alone. This procedure will ensure that a record is created in the rDealClassRules table for every
		combination of deal classification codes (dcA values on the rDealClassA table).
32.0	Usp_ProdPush	This routine is used in the 'Availability' phase of EMS and is used to initially populate a particular month with ownership interest information, by meter/well.
33.0	Usp pPushMeter	This routine is used in the 'Availability' phase of EMS and is used to populate a
		single meter/well ownership interest to its respective deal (package) and volume inventory item (GasInv/GasInvD).
34.0	Usp_pRouteBuildLegHistory	This routine creates the 'Leg' records for a given meter/well. When a new 'route' (LegRef) is defined on the system then this routine will get invoked to initially seed the 'Leg' table with entries in order to allow routing.
35.0	Usp_pRouteBuildLegHistoryAll	This routine gets invoked when a production month is initially opened to the 'Sales' phase. All ACTIVE meters and legs will have their respective 'Leg' table records populated for that production month by this routine.
36.0	Usp_pRouteCopyLegHistoryActuals	This routine gets invoked when the status of a production month changes from 'Sales' to 'Invoiced'. All nomination routine instructions (in the 'LegDetail' table) are then copied by this routine. This provides the mechanism to have actuals different than noms while preserving the nom instructions.
37.0	Usp_pRoutePostChange	This procedure gets invoked whenever a change to a specific route is requested (i.e. modifications of volumes between hops).
38.0	Usp_pRoutePostDealInfo	This procedure gets invoked to 'seed' the 'LegDetail' table with routing information. This is invoked when new meters/wells are added to deals.
39.0	Usp_pRoutePostDealInfoVols	This procedure gets invoked to populate the specific volumes on each of the 'LegDetail' entries (daily) for deal inventory items.
40.0	Usp_pRoutePostDelete	This procedure gets invoked whenever a deletion is requested on the routing (LegDetail) information.
41.0	Usp_pRoutePostLegRates	This procedure gets invoked in order to post the rates (fuel, pvr, transport, gathering, etc) to each of the 'LegDetail' records in the database. Daily rates (LegD table) overrides monthly rates (Leg table) and this procedure ensures that pnority. If a rate gets changed for a leg this routine gets invoked to update all existing routes (LegDetail) records.
42.0	Usp_pRoutePostSale	This procedure gets invoked in order to post volume (route it) to a sales item (in the LegDetail table).
43.0	Usp_pRoutePostTransport	This procedure gets invoked in order to post volume (route it) to a transportation point (in the LegDetail table).
44.0	Usp_pRouteRemoveLegDetails	This routine will remove any/all 'LegDetail' (routing instructions) when a meter/well for a specific deal is removed.
45.0	Usp_pSERPT_GetAdditionalReportInfo	This routine is used by all of the 'standard' reporting procedures to obtain specific report fields needed when running a standard report.
46.0	Usp_pSERPT_PostReportToCorrespondence	This routine will post a 'PackageCorrespondence' table record to a particular deal that is affected by the 'standard' report being run. This routine is called by all standard report routines.
47.0	Usp_pSERPT_PostReportToDistribution	This routine will post a report distribution request to the SERptsQueueDistribute table. This is either a request to 'PRINTER', 'EMAIL' or 'FAX'.
48.0	Usp_pSERPT_PostReportToQueue	This routine is used by all of the standard report routines and will post an actual report request (queue item) to the SERptsQueue table.
49.0	Usp_pSERPT_RunReportAvailConfirms	This routine is responsible for running the 'Availability' confirm reports.
50.0 51.0	Usp_pSERPT_RunReportAvailEstimates Usp_pSERPT_RunReportDealConfirm	This routine is responsible for running the 'Availability' estimate reports. This routine is responsible for running the deal confirmation reports (from the deal detail screen on EMS).
52.0	Usp_pSERPT_RunReportInvoice	This routine is responsible for running all standard invoice reports.
53.0	Usp_pSERPT_RunReportRemittance	This routine is responsible for running all standard remittance reports.
54.0	Usp_pSERPT_RunReportVoucher	This routine is responsible for running all standard voucher reports.
55.0	Usp_pSERPT_SetAParameterBoolean	This routine is used by the standard reporting routines and converts Boolean parameters for posting on the report queue (SERptsQueue) table. This routine is used by the standard reporting routines and converts date and
56.0	Usp_pSERPT_SetAParameterDate	date/time parameters for posting on the report queue (SERptsQueue) table.
57.0	Usp_pSERPT_SetAParameterDecimal	This routine is used by the standard reporting routines and converts decimal (number) parameters for posting on the report queue (SERptsQueue) table.
58.0	Usp_pSERPT_SetAParameterInteger ``	This routine is used by the standard reporting routines and converts integer number parameters for posting on the report queue (SERptsQueue) table.
59.0	Usp_pSERPT_SetAParameterString	This routine is used by the standard reporting routines and converts string parameters for posting on the report queue (SERptsQueue) table.

Ref#	Stored Procedure Name	Description/Comments - Section - Sec
60.0	Usp_pSERPT_WhichReport	This routine is used by the standard reporting routines and is responsible for
		determining WHICH report to use. The default reports are in KreportDefaults
		table. However, any given contract can override the default (KreportOverrides
		table).
61.0	Usp_PSPrice	This is the main pricing routine for the volume inventory items (regular
<u></u>		purchases and sales).
62.0	Usp_PSPriceAll	This is the main procedure for calculating the prices for a given month on a set
1		of deals (volume inventory pricing, STID 8 & 9). Parameters to this stored
_		procedure dictate the type of price to calculation (Nom or Pipe/Field Actual and
62.6	Usp PSPriceAnyNewInvoicesNeeded	Sales versus Purchase, etc.).
63.0	USP_PSPICEATIVITEWITVOICESTREEDED	This routine is responsible for assigning new invoice and remittance numbers to the volume inventory table (Gasiny). If new meters/wells (volume entries) get
		entered during the actualization process then this routine will ensure they are
		assigned unique numbers.
64.0	Usp PSPriceAssignInvoiceNo	This routine assigns invoice numbers to all sales deals when the production
		month is promoted to the 'Invoiced' phase.
65.0	Usp PSPriceAuto	This procedure run everyday and checks for any production month either in the
		'Sales' or the 'Invoiced' phase. If any production months are within these
l		phases then this procedure will invoke the calculation routine
		(usp_psPriceAutoMonth) for them.
66.0	Usp_PSPriceAutoMonth	This is the main driver routine for the calculation of an entire month.
67.0	Usp_PSPriceComponentsCheck	This procedure will automatically insert system generated price components (like
		WASP or Netback Percentage) to the Engine Master table. It is invoked by the
600	Usp_PSPriceCost	usp_PSPricel procedure when calculating prices on a deal for a given month.
68.0	USP_PSPriceCost	This is the routine that calculates the 'Other Cost' entries and posts calculated results in the Engine table.
69.0	Usp_PSPriceCostAll	This is the main driver routine for looping through all of the 'Other Costs' in a
00.0	03p_1 07 1130 0000 til	given month and invoking the usp_PSPriceCost routine for each one.
70.0	Usp PSPriceCreateActualEntries	This procedure copies the pricing entries setup on each deal
		(Engine_MasterPrice) from nom to actuals.
71.0	Usp_PSPriceMarkActualAdjustments	This procedure gets invoked by the calculation routine to mark any volume
		inventory item (GasInv) whenever a difference is detected between nominations
		and actuals.
72.0	Usp_PSPricePopulateEngine	This procedure will populate the Engine table FROM the Engine Master table.
		For daily index price entries this procedure will automatically propagate the daily index price to all days of the month where there is a volume (at least until a new
		pricing entry is found). Only volume entries are populated here (STID 8 & 9).
73.0	Usp PSPriceTransportAll	This routine calculates all of the transport costs for a given production month.
	66 , 0	These transport costs (and volumes) are posted in the Gasinv (pricetype=3)
		table and deals are posted (if needed). These deals are tagged with the specific
		transport contract.
74.0	Usp_PSPriceWASPCalc	Determines and resolves all wasp 'Common' and 'Dedicated' pools. Dedicated
1		pools are sanctioned sales. This is the main driver procedure for the wasp
		portion of the calculation. Third party (pool = 'None') are also processed within
. [this procedure but not for the intent of obtaining a price for them, totals used
75.0	Usp_PSPriceWASPCalcResolveDriver	primarily for profit margin reporting. This is the main driver component for driving the WASP calculation.
76.0	Usp_PSPriceWASPCalcResolveN	Traces back sales totals from all sales meters back to their originating purchase
10.0	Cap_i of floorandi Galartesoladia	points. The table updated here is the WASPResolvedRouting table. The
Ì		'LegDetail' table is used extensively in this calculation. This is a highly
		ITERATIVE process.
77.0	Usp_PSPriceWASPCalcResolveSalesN	This procedure creates the entries in the WASPResolvedRouting table and
ŀ		posts original sales volumes and amounts. This is done just prior to the routine
	200 1 111000 110 111	that resolves these sales totals back to the purchase points.
78.0	Usp_PSPriceWASPCalcSalesN	Sums all WASPable sales by sales meter into the WASPSalesMeterTotals table.
79.0	Usp_PSPnceWASPClearMonth	This routine runs when a production month is promoted to 'Completed' phase.
j	•	Any volume inventory items (Gashrv and/or GashrvD) or routing items
1	•	(LegDetail) that contain zeros are removed so that only relevant information is stored in the database for historical purposes.
80.0	Usp PSPriceWaspDivieOutProceedsN	This procedure is the main procedure that will distribute the proceeds from those
00.0	Dahir at lines and harmen on the constant of	deals that have been designated to have their respective proceeds from those
l	`	via the 'Financial Overrides' setup on the deal.
81.0	Usp_ProdVolSet	This routine is used in the 'Availability' phase to setup the ownership interest on
		a particular pipe/field and meter. ProdSum and ProdVol tables for the current
_ [production month are populated with this procedure.

Ref#	Stored Procedure Name	Description/Comments
82.0	Usp_ProdVolSetAll	This routine is used in the 'Availability' phase to setup the ownership interest on all pipe/fields and meters. This routine invokes the usp_ProdVolSet routine for each meter/well in the toop.
83.0	Usp_PSRollover	This routine gets invoked when a production month goes from 'Availability' to 'Sales' and is responsible for copying deal information month-to-month.
84.0	Usp_PSRolloverPopActuals3	This routine gets invoked by the usp_PSRollover routine and is responsible for populating noms with previous 3 months actuals numbers (primarily used for Oil).
85.0	Usp_PSRolloverPopNoms	This routine gets invoked by the usp_PSRollover routine and is responsible for populating noms with previous months nom numbers.
86.0	Usp_pStatusChanged	This routine gets invoked anytime the production month status is changed (Initial, Availability, Sales, Invoiced, Accounting, Completed). Other routines are invoked depending on the from and to status for the production month.
87.0	Usp_w.*	Any stored procedure that begins with Usp_w_ has been setup as a one time only procedure that is used to correct any database items/etc. These procedures can be permanently deleted and have no impact on existing functions within EMS.

Application Software

TECHNICAL SKILL SET REQUIRED

Support and maintenance of the Energy Management System requires the following technical skill set.

Ref#	Skill Set	Used For
1.0	SQL-Server (Transact SQL)	All data is stored in MS SQL-Server database tables. This data is accessed via direct SQL statements (embedded in windows applications, stored procedures and reports). There are several database views that have been setup to access aggregated information (for performance and consistency). In addition all of the critical calculations and time consuming procedures (like the main EMS calculation, routing and rollover process) are written as Transact-SQL stored procedures (and documented in this manual).
2.0	Delphi (V5 +) (includes Delphi 3 rd party tools)	All client applications are written using this particular RAD tool. In addition to knowing the standard components that come with this tool, any of the 3 rd party tools (documented in this manual) are used extensively. See the 3 rd party tools listed in the 'Tools Utilized' section for more details.
3.0	Crystal Reports (V8.0)	All reporting within EMS is done utilizing this tool from Seagate software.

CLIENT, SERVER APPLICATIONS W/TOOLS UTILIZED

This particular section contains the high level documentation relative to the Energy Management System software application. Each item documented is uniquely numbered to aid in reviews and/or future modifications.

Ref#	Item	Response	Comments
1.0	Client Application	Energy Management System	The Energy Management System is written in Delphi 5 (service pack 3 applied). Third party controls and components were used in the development. See other areas of this matrix for 3 rd party tools utilized.
2.0	Client Application	Producer Control Center	The Producer Control Center is written in Delphi 5 (service pack 3 applied). Third party controls and components were used in the development. See other areas of this matrix for 3 rd party tools utilized. This application provides a restricted view of information specific to the company/contact that is running the application. The data viewed is the same data that is maintained in the EMS system.
3.0	Server Application	Software Experts, Inc. SECrystal (V8.00)	All reporting done within EMS utilizes Crystal reports. This server application runs and stores all output reports for the system. Besides storing an electronic copy of the report, this server can distribute to a printer, fax folder OR an email address if instructed by the EMS application.
4.0	Server Application	Software Experts, Inc. SEFax (V2.00) (outbound faxing)	Some output reports (from SECrystal) are designated to be faxed. This software is responsible for faxing all of the reports that were designated by EMS to be faxed.

Ref#	ltem-	Response	Comments Sage - Sage
5.0	Server Application	Software Experts, Inc. SEServer (V2.00g) (database request server)	All database requests for the Energy Management System AND the Producer Control Center go through this database server component. This server application typically runs on the same machine as the actual database.
6.0	3 ^{re} Party Tool/Library	Adobe Acrobat Reader (V4.0 +)	This free tool is used to view reports from EMS. The default for all reports is to print them to a PDF format. This output format is 'overrideable' by the user when the report is submitted. Other formats like Excel, Word, Text, etc. are also supported.
7.0	3 rd Party Tool/Library	Seagate Software Crystal Reports (V8.00)	All reports are written using the Crystal reporting tool from Seagate Software). In addition, the report server (SECrystal) utilizes the main Crystal reporting FREE runtime libraries to run these reports for all EMS client requests.
80	3rd Party Tool/Library	Dalco Technologies DbOvernet (V200)	Delphi VCL components that provide internet (TCP/IP) access. The SEServer application utilizes this middleware.
9.0	3 [™] Party Tool/Library	TurboPower Software Asynch Pro (V3.04)	The SEFax fax server application utilizes this 3 rd party Delphi VCL component list for sending and/receiving faxes. The SECrystal reporting server application uses this library to write out 'fax ready' files.
10.0	3 rd Party Tool/Library	TurboPower Software Orpheus (V3.08)	Many of the online screens for all client and server applications utilize the Orpheus controls for screen grid lists, combo boxes, etc. The server applications were written with this tool set also.
11.0	3 rd Party Tool/Library	TurboPower Software SysTools (V3.02)	Many of the online screens for all client and server applications utilize the SysTools components for string manipulations, spawning tasks, etc.
12.0	3 rd Party Tool/Library	Woll2Woll Software InfoPower 2000.17	Many of the online screens for all client and server applications utilize these controls for screen grid lists, combo boxes, etc. The server applications were written with this tool set also.
13.0	3 rd Party Tool/Library	Inner Media Software Dynazip (V4.00)	These are Delphi software components that are for compression/decompression of files to and from the server. This is used by both the client and server applications.
14.0	3 rd Party Tool/Library	Public Domain TEmail (V2.10)	This is a Delphi software component and is used by the client and server applications. It is responsible for the email interface.
15.0	3 ^{ro} Party Tool/Library	TMS Software TwebUpdate (V1.00)	This is a Delphi software component that provides for 'over the internet' automatic software upgrades. The client applications each utilize this component.
16.0	3 ^α Party Tool/Library	Skyline Software, Inc. ImageLib Suite (V5.00)	These are Delphi software components that provide for graphic images displayed within the application. In addition, this software provides scanner input capabilities.

CLIENT APPLICATIONS, MODULE LIST/DESCRIPTIONS

This particular section contains the high level documentation relative to each software application module within the Energy Management System. Each item documented is uniquely numbered to aid in reviews and/or future modifications. The application reference listed below will either indicate EMS (Energy Management System) and/or PCC (Producer Control Center). This shows the level of interoperability between these two client applications. All of these modules are written in Delphi (Object Pascal, (Visual)).

Ref#	Module Name	Module Type	Application	Description/Comments
1.0	DBAddress	Data Module	EMS PCC	This module contains all of the database communication components for the Address ('Company and Contact Addresses') table.
2.0	DBCommonDatabase	Data Module	EMS PCC	This module is responsible for setting all of the common properties for all other data modules within the system. Prior to invoking a query, all other database modules will invoke methods within this module to set communication ports, maximum number of records, etc. This module also stores the actual user id and contains methods for accessing this field.

Ref#	Module Name	Module Type	Application	Description/Comments -
3.0	DBCommonFileOperations	Data Module	EMS	This module handles all of the 'flat file' operations
1			PCC	(compressing/decompressing/etc.) that is involved with the
				applications. Any temporary files that need to be created
	<u> </u>			are also controlled by this data module.
4.0	DBCompany	Data Module	EMS	This module contains all of the database communication
1			PCC	components for the Company ('Company Information') table.
5.0	DBContactFunction	Data Module	EMS	This module contains all of the database communication
3.0	DBComach directors	Data Module	PCC	components for the ContactFunction ('Roles within their
}			1.00	respective companies that contacts play") table.
6.0	DBContacts	Data Module	EMS	This module contains all of the database communication
		į	PCC	components for the Contacts ('Individual contacts within
				companies') table.
7.0	DBContactGroup	Data Module	EMS	This module contains all of the database communication
1	1		PCC	components for the ContactGroup (Links contacts to groups they may be affiliated with) table.
8.0	DBContact_GroupNames	Data Module	EMS	This module contains all of the database communication
0.0	DBContact_oroopivames	DELE IVIOGUIC	LIVIO	components for the Contact_GroupNames (table contains
		}		a record for each group within the system) table.
9.0	DBEngine	Data Module	EMS	This module contains all of the database communication
l	1			components for the Engine (contains transaction records
	1	Ì	1	for each volume inventory transaction item associated with
10.0	DBEngine Master	Data Module	EMS	the deal) table. This module contains all of the database communication
10.0	DBEngine_iviaster	Data Module	LIVIG	components for the Engine_Master (User enterable pricing
	ļ			area 'header' record) table.
11.0	DBEngine_MasterPrice	Data Module	EMS	This module contains all of the database communication
1			1	components for the Engine_MasterPrice (User enterable
			<u> </u>	pricing area 'detail' records (price tags)) table.
12.0	DBEngine_TransactionList	Data Module	EMS	This module contains all of the database communication
		ł		components for the Engine_TransactionList (transaction descriptions) table.
13.0	DBExceptionCategories	Data Module	EMS	This module contains all of the database communication
			PCC	components for the ExceptionCategories ('Reasons for
				Exceptions') table.
14.0	DBExceptionList	Data Module	EMS	This module contains all of the database communication
			PCC	components for the ExceptionList ('Actual Exception Events) table.
15.0	DBGasinv	Data Module	EMS	This module contains all of the database communication
15.5	DDCa5v			components for the Gasinv (Volume inventory 'header')
				table.
16.0	DBGasInvD	Data Module	EMS	This module contains all of the database communication
		1		components for the GasInvD (Volume Inventory Daily
47.0	DRCC8 was	Data Module	EMS	'detail') table. This module contains all of the database communication
. 17.0	DBGCButton	Data Module	PCC	components for the GCButton ('Business Functions')
			. 55	security table.
18.0	DBGCIndex	Data Module	EMS	This module contains all of the database communication
			PCC	components for the GCIndex (Daily & Monthly Price
				Indices) table.
19.0	DBGCSecurity	Data Module	EMS	This module contains all of the database communication
			PCC	components for the GCSecurity (Security Authorizations) for the applications.
20.0	DBGCUser	Data Module	EMS	This module contains all of the database communication
20.0	DDGGGsei		PCC	components for the GCUser (User Profiles) table within the
- 1				applications.
21.0	DBImages	Data Module	EMS	This module contains all of the database communication
l	•	1.		components for the SEImages (company logos, etc.) table
	ODI - Destroy - I	Date Martin		within the application.
21.0	DBIndexBasketLink	Data Module	EMS PCC	This module contains all of the database communication components for the IndexBasketLink (Links actual indices
ł			100	to a particular basket) table within the application.
22.0	DBIndexBaskets	Data Module	EMS	This module contains all of the database communication
			PCC	components for the IndexBaskets (Grouping of indices to
-		1		be used in a 'simple' averaging calculation) table within the
				application.

Ref#	Module Name	Module Type	Application	Description/Comments
23.0	DBIndexRef	Data Module	EMS PCC	This module contains all of the database communication components for the IndexRef (Each price index within the system contains a record entry here) table within the
24.0	DBK	Data Module	EMS	application. This module contains all of the database communication components for the K (Contracts table within the
25.0	DBKNetBack	Data Module	EMS	application). This module contains all of the database communication components for the KNetBack (Contracts Netback Percentage Tiers) table within the application.
26.0	DBKNotes	Data Module	EMS	This module contains all of the database communication components for the KNotes (Contract Notes) table within the application.
27.0	DBKProducts	Data Module	EMS	This module contains all of the database communication components for the KProducts (products that are available within contracts) table within the application.
28.0	DBKReportDefaults	Data Module	EMS	This module contains all of the database communication components for the KReportDefaults (standard report defaults) table within the application.
29.0	DBKReportOverrides	Data Module	EMS	This module contains all of the database communication components for the KReportOverrides (standard report overrides for a contract) table within the application.
30.0	DBKServices	Data Module	EMS	This module contains all of the database communication components for the KServices (services that are available within contracts) table within the application.
31.0	DBLeg	Data Module	EMS	This module contains all of the database communication components for the Leg (available routes and rates for the production month) table within the application.
32.0	DBLegD	Data Module	EMS	This module contains all of the database communication components for the LegD (available DAILY routes and rates for the production) table within the application.
33.0	DBLegDetail	Data Module	EMS	This module contains all of the database communication components for the LegDetail (specific routing instructions for all volumes purchased and sold) table within the application.
34.0	DBLegRef	Data Module	EMS	This module contains all of the database communication components for the LegRef (master list of routes and rates) table within the application.
35.0	DBLocations	Data Module	EMS PCC	This module contains all of the database communication components for SELocations (locations) table within the application.
36.0	DBMessages	Data Module	EMS PCC	This module contains all of the database communication components for the SEMessages (system messages) table within the application.
37.0	DBMeter	Data Module	EMS	This module contains all of the database communication components for the Meter/Well table within the application.
38.0	DBMeterAllocations	Data Module	EMS	This module contains all of the database communication components for the MeterAllocations (ownership interests in volume from a meter/well) table within the application.
39.0	DBMeterNotes	Data Module	EMS	This module contains all of the database communication components for the MeterNotes table within the application.
40.0	DBMeterRates	Data Module	EMS	This module contains all of the database communication components for the MeterRates (pressure base, Btu factor, etc. from a meter/well) table within the application.
41.0	DBMiscQuenes ,	Data Module	EMS PCC	This module contains all of the miscellaneous queries that were created to enable views of various tables within the application.
42.0	DBPackage	Data Module	EMS	This module contains all of the database communication components for the Package (Deals) table within the application.
43.0	DBPackageCorrespondence	Data Module	EMS	This module contains all of the database communication components for the PackageCorrespondence (electronic copies of documents associated with deals) table within the application.

Ref#	Module Name	Module Type	Application	Description/Comments
44.0	DBPackageCosts	Data Module	EMS	This module contains all of the database communication
]			components for the PackageCosts ('Other Costs'
	<u> </u>			associated with deals) table within the application.
45.0	DBPipeField	Data Module	EMS	This module contains all of the database communication
				components for the PipeField (Pipe/Field information) table
46.0	DBPriceComponents	Data Module	EMS	within the application.
46.0	DernceComponents	Data Module	EMS	This module contains all of the database communication components for the PriceComponents (tags to associate to
				each portion of a price) table within the application.
47.0	DBPriceDesc	Data Module	EMS	This module contains all of the database communication
		1		components for the PriceDesc (Deal free form price
				description) table within the application.
48.0	DBPrinterDef	Data Module	EMS	This module contains all of the database communication
				components for the PrinterDef (printer definitions) table
40.0	DDDssassingCadas	Data Module	5146	within the application.
49.0	DBProcessingCodes	Data Module	EMS PCC	This module contains all of the database communication components for the SEProcessingCodes (reference code
		7		description) table within the application.
50.0	DBProcessingCodeTyes	Data Module	EMS	This module contains all of the database communication
				components for the SEProcessingCodeTypes (type codes
				that classify sets of reference codes) table within the
	<u> </u>			application.
51.0	DBProducerMessage	Data Module	PCC	This module contains all of the database communication
	1			components for the ProducerMessage (dynamic messages
52.0	i DBProdinterest	Data Module	EMS	posted to producers) table within the application. This module contains all of the database communication
JZ.U	Derioniciost	- Satu Module		components for the Prodinterest (Availability royalty
				interests) table within the application.
53.0	DBProdPKG	Data Module	EMS	This module contains all of the database communication
			1	components for the ProdPKG (Availability deal ID to
	500 - dC	Date Married	 	ProdVol cross reference) table within the application.
54.0	DBProdSum	Data Module	EMS	This module contains all of the database communication components for the ProdSum (Availability summary totals
				by meter/well) table within the application.
55.0	DBProdVol	Data Module	EMS	This module contains all of the database communication
			1	components for the ProdVol (Availability detail owner
			<u> </u>	interest totals by meter/well) table within the application.
56.0	DBrDealClass	Data Module	EMS	This module contains all of the database communication
			J	components for the rDealClass (All of the available deal
57.0	DBrDeaiClassA	Data Module	EMS	classifications) table within the application. This module contains all of the database communication
37.0		Data Middle	CIVIO	components for the rDealClassA (all possible answers
	•			available to the deal class rules (rDealClass table)) table
				within the application.
58.0	DBrDealClassRules	Data Module	EMS	This module contains all of the database communication
ĺ				components for the rDealClassRules (all rules associated
			}	with every combination of deal classification) table within the application.
59.0	DBrGasMonth	Data Module	EMS	This module contains all of the database communication
33.0	60. Jasmona.		PCC	components for the rGasMonth (an entry exists here for
]				every possible month within the system, with status
j				information) table within the application.
60.0	DBRptsControl	Data Module	EMS	This module represents the main driver module for
			PCC	submitting reports.
61.0	DBRptsExecutedStats	Data Module	EMS	This module contains all of the database communication
ļ	, ,		PCC	components for the SERptsExecutedStats (Execution statistics for reports) table within the application.
62.0	DBRptsGroupitems	Data Module	EMS	This module contains all of the database communication
JZ.U	DE TRECTORIES	-tare Modele	PCC	components for the SERptsGroupItems (List of reports
l		, ,		available within each tab/folder) table within the
				application.
63.0	DBRptsGroups	Data Module	EMS	This module contains all of the database communication
- 1		1	PCC	components for the SERptsGroups (List of all tabs within
				each reporting folder) table within the application.

Ref#	Module Name	Module Type	Application	Description/Comments
64.0	DBRptsItemDetail	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsitemDetail (List of specific reports available throughout all folders and tabs) table within the application.
65.0	DBRptsitemParms	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsItemParms (List of all report parameters available to each specific report) table within the application.
66.0	DBRptsQueue	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsQueue (actual report submission queue) table within the application.
67.0	DBRptsQueueDistribute	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsQueueDistribute (report distribution instructions area) table within the application.
68.0	DBRptsQueueNotify	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsQueueNotify (report notification instructions area) table within the application.
69.0	DBRptsSchedule	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsSchedule (report schedule definition area) table within the application.
70.0	DBRptsScheduledReports	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsScheduledReports (reports belonging to schedule definition area) table within the application.
71.0	DBRptsScheduleGroups	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsScheduleGroups (report schedule groups definition area) table within the application.
72.0	DBRptsScheduleUserGroups	Data Module	EMS PCC	This module contains all of the database communication components for the SERptsScheduleUserGroups (user list belonging to a specific schedule group definition area) table within the application.
73.0	DBRptsTablesUsed	Data Module	EMS PCC ·	This module contains all of the database communication components for the SERptsTablesUsed (tables, views and stored procedures used by each report area) table within the application.
74.0	DBStoredProcedures	Data Module	EMS PCC	This module contains all of the database communication components for accessing and invoking all stored procedures and functions on the application. Each of these procedures are setup as methods within this class and this particular class acts as a common wrapper for invoking these DB procedures.
75.0	RTCrystalDriverParseMemo	Business Rules	EMS PCC	This module contains all of the string parsing routines used to store reporting parameters, formulas and selection criteria.
. 76.0	RTDBAddress	Business Rules	EMS PCC	All business rules and edits associated with the application addresses (Address table) are within this particular module.
77.0	RTDBCompany	Business Rules	EMS PCC	All business rules and edits associated with the application companies (Company table) are within this particular module.

148.0	FmActualizePurchases	Form	EMS	This form provides the method for performing (Step 2 of 4) of the actualization process within EMS.
149.0	FmActualizeSales	Form	EMS	This form provides the method for performing (Step 3 of 4) of the actualization process within EMS:
150.0	FmAddressDetail	Form	EMS	This form provides for the updating of addresses for contacts and companies. The table that gets updated behind the scenes is the Address table.
151.0	FmAddressList	Form	EMS	This form provides a list of all available addresses that have already been setup for a company. Options on this form include an ability to change, add or delete address lines from the list.
152.0	FmBusinessFunctionsDetail	Form	EMS	This form provides for the updating of the business functions that are available within the Energy Management System AND the Producer Control Center. The table that gets updated (behind the scenes) is the 'GCButton' table.
153.0	FmBusinessFunctionsList	Form	EMS	This form provides a list of all available business functions that are currently within the Energy Management System AND the Producer Control Center. Options exist here to add, change and delete business functions. Each of these business functions represent areas within the application for setting system security.
154.0	FmCommon	Form	EMS PCC	This form provides for all of the common properties used by all forms. This form can be accessed via the main menus by selecting system properties. All of the color schemes, graphic images, etc. that are used by the system are included on this form. At runtime, all other forms within the system will invoke public methods within this form to set their respective screen fields.
155.0	FmCompanyDetail	Form	EMS	This form provides the mechanism for updating detail information pertaining to a specific company. This includes identification of a primary company address.
156.0	FmCompanyList	Form	EMS	This form provides a gnd list of all companies that are currently stored on EMS. Options on this form include extensive lookup and tab options.
157.0	FmContactDetail	Form	EMS	This form provides the form for updating detail information about a contact at a particular company. This includes group memberships, functions, etc.
158.0	FmContactFunctionDetail	Form	EMS	This form provides the mechanism for associating a contact within a company to a specific job function at that company (i.e. Accounting, production, etc.).
159.0	FmContactGroupDetail	Form	EMS	This form provides the mechanism for creating or updating contact groups on the system.
160.0	FmContactGroupList	Form	EMS	This form lists all available contact groups on the system. Options on this form include the ability to add, change or delete a contact group.
161.0	FmContactList	Form	EMS	This for lists all contacts within all companies. Options on this form include an ability to add, change or delete a specific contact (with appropriate security). In addition, there are extensive data lookup capabilities.
162.0	fmContactSecurityAuth	Form	EMS	This form provides for the entry of external company security authorization rules (i.e. Enabling access to Producer Control Center, etc.).
163.0	FmContractDetail	Form	EMS	This form represents the detail form for entering contract specific information (netback pricing information, contract name, terms, provisions, etc.).
164.0	FmContractList	Form .	EMS	This form provides a grid list of all existing contracts on the system. Options exist on this form to add, change or delete a contract. This form also includes extensive lookup and company letter tab's for searching all contracts.
165.0	FmDailyPrices	Form	PCC	This form shows the graphs of the revenue detail information on the Producer Control Center.
166.0	FmDealClassificationUpdates	Form	EMS	This form provides the mechanism for changing any calculation rules associated with a given combination of deal classification codes. The WASP inclusion indicator is stored on this table.
167.0	fmDealCorrespondenceDetail	Form	EMS	This form provides an entry form for attaching electronic correspondence to a deal.

Ref#		Module Type	e Application	on Description/Comments
168.0	FmDealCostsEntryDetail	Form	EMS	This form provides for the entry of 'Other Costs' associated with a particular deal.
169.0	FmDealDetail	Form	EMS	This is the main detail form that shows all of the information relative to a deal.
170.0	FmDealEntryNew	Form	EMS	This form represents a popup box that is displayed when a new deal has been requested. This box prompts the user for the type of deal (purchase or sale) and what product and service it is applicable toward.
171.0	FmDealList	Form	EMS	This form provides a listing of all 'Purchase' or 'Sales' deals within a given month on a grid. Options exist on this screen to add, change or delete a deal.
172.0	FmDealPrice	Form	EMS PCC	This is the form that is used whenever a user wants to calculate the prices for a given volume within a given month. The only options on this form are to 'Price All' and only for those production months and volumes that are applicable (based on monthly status).
173.0	FmDealPriceEntryDetail	Form	EMS	This is the main form for entering deal price information within the Energy Management System. The primary underlying tables that get updated include Engine_Master and Engine MasterPrice.
174.0	FmException :	Form	EMS PCC	This form is invoked whenever a system exception occurs within the system. In order to complete the exception a particular user must have a 'Super ID' for the function and he/she must provide an exception reason with a description.
175.0	FmExceptionCategoriesDetail	Form	EMS	This form provides for a detail update screen to update reason code information for a given type of exception.
176.0	fmExceptionCategoriesList	Form .	EMS	This form provides a listing grid of all reason code exceptions for a given type of exception.
177.0	FmGraphicViewer	Form	EMS	This form provides an ability to view graphic images and/or scan in graphic images from a scanner. These images can be attached to a deal.
178.0	fmGroupMemberDetail	Form	EMS	This form represents the detail form for associating a contact as a member of a specific group.
179.0	FmlmagesDetail	Form	EMS	This form represents the detail form used for posting updates to the application graphic images (logo's, etc.).
180.0	FmlmagesList	Form	EMS	This form provides a list of all graphic images (logos) that are currently stored in the system.
181.0	FmIndexBasketDetail	Form	EMS	This form provides a detail update screen to update index price basket information.
182.0	FmIndexBasketLinkDetail	Form	EMS	This form provides a detail update form to allow for the updating of index links to particular baskets.
183.0	FmIndexBasketList	Form	EMS	This form provides a listing grid of all index baskets on the system.
184.0	FmLegDailyDetail	Form	EMS -	This form provides the detail rate information associated with a daily leg rate (which overrides the monthly rate when setup on EMS).
185.0	FmLegDailyList	Form	EMS	This form provides a listing of all daily rates that may be setup for a particular leg.
186.0	FmLegDetail	Form	EMS	This form provides the detail rate information associated with the a given leg, on a given production month within the system. Both nomination and actual rate information is available.
187.0	FmLegHistory	Form	EMS	This form provides a historical list of all monthly leg rates that have been established for a given leg.
188.0	FmLegList " .	Form	EMS	This form provides a list of all legs on the system. Options exist from this screen to select and change (modify) the specific rate information about a leg.
189.0	FmLegMonthlyView	Form	EMS ·	This form represents a 'view' form that provides a read- only view of all volumes transported in, out, sold and/or on balance for a specific meter.
190.0	FmLegPurchaseLinkMonthlyView	Form	EMS	This form represents a 'view' form that provides a read- only view of all the purchase deals (volumes) that have been attributed to a selected sale.
191.0	FmLegPurchaseLinkView	Form	EMS	This form represents a 'view' form that provides a read- only view of all purchases linked to a specific sale on a given day.

Ref#	Module Name	Module Type-	Application*	Description/Comments
192.0	FmLegPurchasePointView	Form	EMS	This form represents a 'view' form that provides a read- only view of the originating (hop 0) information for any given volume that is displayed on the routing screen(s).
193.0	FmLegRoute	Form	EMS	This is the main routing screen. Options exist on this screen to select pipe/fields, days, noms or actuals, etc. With appropriate security a person can transport and/or sell volume through this panel.
194.0	FmLegSale	Form	EMS	This form is used as a confirm form for posting volume balances to a sale.
195.0	FmLegSalesView	Form	EMS	This form represents a 'view' form that provides a read- only view of all sales that exist on a given pipe/field for either a single day or an entire month.
196.0	FmLegTransport	Form	EMS	This form is used as a confirm form for transporting volumes to other meters (pools). Options also exist on this form to selectively override transport, gathering, pvr or fuel rates associated with the transport.
197.0	FmLegChange	Form	EMS	This form is used whenever a request is made to change the instructions (either volume or rates) on an existing transport OR sale route item.
198.0	fmLegDelete	Form	EMS	This form is used whenever a routed volume (either transported to a pool or posted to a sale) has been requested to be deleted.
199.0	FmLocationsDetail	Form	EMS	This form provides a detail update form to allow for the updating of location information. These location entries are used throughout the system (versus hardcoding locations within the software).
200.0	fmLocationsList	Form	EMS .	This form provides a list form to allow for showing the location information. These location entries are used throughout the system (versus hardcoding locations within the software).
201.0	fmLogin	Form	EMS PCC	This is the common login form used by the application(s). It provides the mechanism for authenticating users or company contacts upon entry into the system.
202.0	fmLoginChange	Form	EMS	This form provides the users of the system with the ability to change their login passwords.
203.0	fmLookup	Form	PCC	This form provides a standard lookup dialog that allows for queries to be run for nearly all other list forms within the system. Most list screens provide a lookup button (binoculars) that will invoke this form.
204.0	fmMessageBox	Form	PCC	This form displays all system messages used within the system. This particular form gets utilized by nearly all other form on the system. The messages displayed by this form include all ERROR, CONFIRMATIONAL, INFORMATIONAL and IN-PROCESS oriented messages.
205.0	fmMeterAllocationsDetail	Form	EMS	This form provides for an entry screen for entering allocation companies and accounting cross reference deck codes for a given meter/well and effective date.
206.0	FmMeterDetail	Form	EMS	This form provides for a detail update form on meter/well information within the system.
207.0	fmMeterList	Form	EMS	This form provides for a list form of all meters/wells within the system.
208.0	fmMeterRatesDetail	Form	EMS	This form provides for an entry screen for entering rates (pressure base, Btu factor, pipe/field pressure base, etc.) for a given meter/well on a specific effective date.
209.0	FmMeterRevenue	Form	PCC	This form provides a meter/well form that shows graphic representation of calculated volumes and prices.
210.0	FmMeterTotalsView	Form 	EMS	This form provides a 'view' which is a read-only view of all the meter totals (actualized versus not actualized) for an entire month). A specific deal OR all deals within a month can be viewed through this form.
211.0	FmMonthlyStatusDetail	Form	EMS	This form provides a screen for updating the detail production month status information. This is where users will go to change the status for each production month (depending on security level of the user).

Ref#		Module Type	Application	Description/Comments (1995)
212.0	FmMonthlyStatusList	Form	EMS	This form provides a grid list of all monthly status information (by status). Options exist here to invoke the detail update screen to update monthly status information (with appropriate security).
213.0	fmNetBackTierDetail	Form	EMS	This form provides the detail form for updating the netback pricing tiers for a given contract. These tiers are referenced (for all WASP classified deals) during the pricing function.
214.0	FmOGISFeeds	Form	EMS	This form provides an entry form for specifying the parameters used to create the OGIS journal entry and revenue receivable accounting feeds. The actual text files are created from this form.
215.0	FmPickACompany	Form	EMS PCC	This form provides a common mechanism for displaying a list of companies to a user and having one of them selected and carried back to the requesting form.
216.0	FmPickAContact	Form	EMS	This form provides a common mechanism for displaying a list of contacts to a user and having one of them selected and carned back to the requesting form.
217.0	FmPickAContract	Form .	EMS	This form provides a common mechanism for displaying a list of contracts to a user and having one of them selected and carried back to the requesting form.
218.0	FmPickADeal	Form	EMS	This form provides a common mechanism for displaying a list of deals to a user and having one of them selected and carried back to the requesting form.
219.0	FmPickADeaiMeter	Form	EMS	This form provides a common mechanism for displaying a list of deal meters to a user and having one of them selected and carried back to the requesting form.
220.0	FmPickALeg	Form	EMS	This form provides a common mechanism for displaying a list of leg (monthly routes) to a user and having one of them selected and carried back to the requesting form.
221.0	FmPickALegRef	Form	EMS	This form provides a common mechanism for displaying a list of LegRef (master routes) to a user and having one of them selected and carried back to the requesting form.
222.0	FmPickALegSale	Form	EMS	This form provides a common mechanism for displaying a list of sales points available for routing to a user and having one of them selected and carried back to the requesting form.
223.0	FmPickAMeter	Form	EMS	This form provides a common mechanism for displaying a list of meters/wells to a user and having one of them selected and carried back to the requesting form.
224.6	FmPickAPipeline	Form	EMS	This form provides a common mechanism for displaying a list of pipe/fields to a user and having one of them selected and carried back to the requesting form.
225.0	fmPickAReport	Form	EMS	This form provides a common mechanism for displaying a list of reports to a user and having one of them selected and carried back to the requesting form.
226.0	FmPipeDetail	Form	EMS	This form provides the detail update form for updating pipe/field information on the system.
227.0	fmPipelineActuals	Form	EMS	This is the main form used for enter actual volumes for meters/wells on the system. The form includes a calculator function for propagating the volumes across all days for the highlighted meter/well.
228.0	fmPipeList	Form	EMS	This form provides the list form to show all pipe/fields currently defined within the system. Options exist on this form to add, update or delete a pipe/field.
229.0	FmPriceComponentsDetail	Form	EMS	This form provides the screen for updating the detail 'price tags' that have been setup on the system. These price tags allow us to identify the various portions of a sale or purchase price.
230.0	FmPriceComponentsList	Form	EMS	This form provides a grid list of all price components (tags) that have been setup on the system.

Ref#	Module Name	Module Type	Application	Description/Comments
231.0	fmPriceIndexUpdates	Form	EMS	This form provides a list of all prices for the daily Index Prices. When entering this form the default date is set to the current date. When prices are being entered on 'Mondays' there is a copy to previous weekend' button which will allow for all prices to be propagated back to the previous weekend. Monthly index prices are entered on day 1 only for a given month.
232.0	FmPriceIndicesDetail	Form	EMS	This form provides a screen for updating the price index information on the database (IndexRef table). This includes display order, name, etc.
233.0	fmPriceIndicesList	Form	EMS .	This form provides an 'updateable' grid list that shows all price indices on the system. Options exist here to invoke the add/update function (fmPriceIndicesDetail).
234.0	fmPricesByIndexList	Form	PCC	This form provides a graphic and tabular view of index prices for a given month.
235.0	FmPrinterDetail	Form	EMS ·	This form provides a detail entry form for updating the printer information stored on the system.
236.0	fmPrinterList	Form	EMS .	This form provides a list form that shows all printers currently defined on the system.
237.0	FmProcessingCodesDetail	Form	EMS .	This form provides the detail form for updating a given set of reference (processing codes).
238.0	FmProcessingCodesList	Form	EMS	This form provides the list form for showing all of the processing codes. Options exist on this form to add, update or delete a given code.
239.0	FmProcessingCodesPick	Form	EMS	This form provides an ability to 'pick' a particular reference code and send it back to the form that invoked the screen.
240.0	FmProcessingCodeTypesDetail	Form	EMS	This form provides the detail form for updating a given set of processing code types (types of reference codes).
241.0	fmProcessingCodeTypesList	Form	EMS	This form provides the list form for showing all of the processing code types. Options exist on this form to add, update or delete a given type.
242.0	FmProdVolCofirms	Form	EMS	This form provides the mechanism for recognizing volumes that were returned by producers. In addition, options exist on this form to send out producer confirmations.
243.0	FmProdVolHist	Form ·	EMS	This form provides a history list of royalty and makeup percentage interests, by owner, for a given meter/well.
244.0	FmProdVolList	Form	EMS	This form provides the mechanism for entering initial volumes (expected availability) from producers. Option exist on this form to send out producer availability estimate reports.
245.0	FmReportDefaultsDetail	Form	EMS	This form provides a detail screen for setting up the default reports that will be used by entity, product and service on the system. These reports include invoices, vouchers, remittance, etc.
·246.0	FmReportDefaultsList	Form	EMS	This form provides a list screen for showing all of the default reports that are setup by entity, product and service on the system. These reports include invoices, vouchers, remittance, etc.
247.0	FmReportOverridesDetail	Form	EMS	This form provides a detail screen for setting up the override reports that will be used by entity, product and service on the system ASSOCIATE TO A SPECIFIC CONTRACT. These reports include invoices, vouchers, remittance, etc.
248.0	FmReportsList	Form	EMS PCC	This is the primary form used for displaying a reporting folder. Within this folder are all of the reporting 'tabs' that are available. Within each tab are all of the specific reports that can be run. A submission, and view button are available here.
249.0	FmReportsParaemeters	Form	EMS PCC	This is the form that is used when entering the various parameters when a report is submitted. Defaults are automatically supplied and the parameters are listed in a grid list format.
250.0	fmReportsView	Form	EMS PCC	This is the main view form for viewing all of the submitted reports. Options exist to view the reports specifically submitted by a user OR to view the reports that were submitted by the scheduler.

Ref#	Module Name	Module Type	Application	Description/Comments
251.0	fmSecurityAuthDetail	Form	EMS	This form represents the form for establishing and updating security authorizations between users and business functions within the Energy Management System. Options exist here to allow for users to have NO ACCESS, READ ONLY, READ/UPDATE, READ/UPDATE/DELETE or SUPER access to a particular area of application.
252.0	fmSecurityAuthList	Form	EMS	This form provides a listing of all security authorizations that are set for each user on the Energy Management System. Options exist on this form to add, update and delete specific security authorizations for any given user of the system.
253.0	FmsRptsInvoice	Form	EMS	This is the primary form used for submitting standard invoice reports.
254.0	FmsRptsRemittance	Form	EMS	This is the primary form used for submitting standard remittance reports.
255.0	fmsRptsVoucher	Form	EMS	This is the primary form used for submitting standard voucher reports.
256.0	FmTransactionDetail	Form	EMS	This form provides for the entry of 'Other Cost' transactions within EMS. Once these transactions are setup in the system, then they can be attached to deals and calculations will be done against them.
257.0	FmTransactionList	Form	EMS	This form provides a list of all the 'Other Cost' transactions that have been setup on the system.
258.0	fmUserProfilesDetail	Form	EMS	This form represents the creation and update form for all users on the Energy Management System. This form provides an administrator with the ability to change name, password, title, default printer, etc. for all users on the system.
259.0	fmUserProfilesList	Form	EMS	This form provides a listing of all users that are capable of using the Energy Management System. Options exist on this form to add, update or delete a specific user.
260.0	fmGasControlMainMenu	Form	EMS	This form represents the main menu for the Energy Management System. All menu options, speed buttons, etc are stored on this form. This particular form is also responsible for invoking the methods to establish a connection and set the form screen attributes (based on user preferences).
261.0	frmProducerControlCenterMain	Form	PCC	This form represents the main menu for the Producer Control Center. All menu options, speed buttons, etc are stored on this form. This particular form is also responsible for invoking the methods to establish a connection and set the form screen attributes (based on user preferences).

APPLICATION (CLIEN-SIDE) SOFTWARE

The table that follows contains the high-level documentation related to the systems and methods provided by the present invention and, in particular, those subfunctions and applications that run client-side in the context of the present invention. In the table that follows, the terms EMS and PCC are used to differentiate (as described above), between a full use application system and a limited use/user/function application system that are provided by the present invention. The actual source code for such application software is contained among the files found on the attached compact disc.

PRICING AND PRICING TECHNIQUES

So far in the aforementioned detailed discussion the present invention, it has been assumed that the particular pricing techniques may be employed to price one or more fuel deals automatically. The present invention certainly permits fuel deals to be priced based on a variety of factors germane to the energy field. Additionally, the systems and methods provided by the present invention permit fuel deals to be priced automatically, in batch or otherwise, based on pricing techniques which are modularized and which are carried out automatically based on prior or other collections of fuel deals and other fuel deal data. Accordingly, teams of sales personnel can have deals priced based on company specifications to meet margin requirements, etc.

20

25

One such technique implemented as a modularized process capable of pricing one or more fuel deals in accordance with the present invention is referred to as the WASP technique which stands for the Weighted Average Selling Price technique. WASP permits one or more fuel deals (usually a collection) to be priced to meet organization pricing targets (and margin requirements) based on computed average sales prices across collections of fuel deals. The WASP technique and its supporting computer software are contained herein for purposes of example to illustrate the novelty of having a system that can incorporate a substitutable pricing technique (algorithm) into a business process like or similar to the one depicted in and discussed in regard to FIG. 1.

The WASP Calculation

This particular section contains information on the calculation that occurs to price deals. In the context of the present invention, it is envisioned that there are three situations that can trigger a pricing calculation:

- The price calculation can be submitted at any time by individuals with appropriate security using the System online pricing screen (see FIGS. 4A-4Q). Only those production months in a 'Sales' (nomination recalculated) or 'Invoiced' (actual recalculated) status can be submitted through this screen;
- 2. When the status for a production month goes from 'Sales' to 'Invoiced' a final nomination is performed. In addition, when the status of a production month goes from 'Invoiced' to 'Accounting' a final actuals calculation is performed. These production month status 'promotions' occur through the EMS online screens (by individuals with an appropriate level of security); and
- 3. Each evening, for example, all production months that are in either the 'Sales' or 'Invoice' status will have a calculation cycle run for them. This calculation begins at approximately 8:00 CST, for example. This ensures that all variables (price index entries, volumes, routing instructions, etc.) that could influence the price of a given set of deals are recalculated and presented as current, the first thing in the morning.

The entire calculation process is comprised entirely of MS SQL-Server Transact-SQL stored procedures. The 'flow' of the calculation can be described with reference to the following six (6) stages:

Stage 1. Sales Deal Calculations

Calculate all sales deals first (all pools and deal classifications). This is done because knowing the sales prices (by pool) is required for the following purchase deal calculations.

5

10

15

20

25

Stage 2 <u>WASP Deal Preparation</u>

This particular stage simply prepares the WASPResolvedRouting table with initial sales pool total dollars and volumes. This is the primary table that is used when repeatedly (such as via iteration) tracing all volumes from the sales point back to originating purchase points.

Stage 3 Purchase Deal 'None' Pool (3rd Party) Calculations

All third party purchase deals (belonging to the 'None' (pool) are calculated first. The reason for this is because of the potential that some of these deals having Financial Overrides that are to be distributed to either a 'Common' WASP pool OR to a specific deal. By doing these calculations first, the profit gain or loss (for the financial overrides) can be determined and posted to the appropriate place in the WASPResolvedRouting table.

Stage 4 Purchase Deal 'Dedicated' Pool (Sanctioned Sales) Calculations

All sanctioned sales purchase deals are now calculated. The price for these purchases is driven based on a weighted average basis of the sales meters. Sanctioned sale purchase exist in their own pool ('Dedicated') so that no other purchases volumes (and sales of those volumes) will impact the price calculated. Netback percentages are applied.

Stage 5 Purchase Deal 'Common' Pool (Equity) Calculations

All equity deals are then calculated. The price for these purchases is driven based on a weighted average basis of the sales meters. All purchases that are classified as 'equity' will share in pricing and costing (weighted). The pricing is based on the 'common' body. Any given purchase deal classified as equity could potentially impact the price that other purchase deals (in the 'common' pool) calculates. Netback percentages are applied.

30

5

10

15

20

25

Stage 6 Transportation Costs

This stage of the calculation aggregates all of the transport volumes throughout the month to special transport deals and volume inventory items.

Each of the aforementioned stages of the calculation are invoked from a stored procedure called **usp_PSPriceAutoMonth**. FIGS. 5A and 5B illustrate the process flows corresponding to these 'stages' and the flow of the stored procedures (discussed above) invoked during the calculation. The ordering of these procedures can be tied back to the stages just described above. Actual WASP calculation routines are listed below to aid the reader to completely understand the nature using a predetermined pricing technique in accordance with the present invention.

Weighted Average Sales Price Calculation Routines

The following software routines implement a weighted average sales pricing technique that may be incorporated within a computing environment such as within a server-side processing system to facilitate fuel deal pricing in accordance with a preferred embodiment of the present invention. Accordingly, in the context of the instant invention, the following routines provide a predetermined pricing technique for pricing fuel deals based on past, present, or future deals, or combinations thereof. The following routines are found among the files contained on the attached compact disc, and also have been commented to assist those of ordinary skill in the art understand the details related to actual implementation.

15	@PIDx INTEGER, @GasMonthx DATETIME, @TypeNetbackx VARCHAR(12), @WhichPricex INTEGER, @yNetbackPercentage DECIMAL(19,8) OUTPUT)
20	AS BEGIN /*
	Name: usp_fGetNetbackPercentage
25 30	Description: This function will return the netback percentage that should be applied to a particular deal, for a particular month. This netback percentage is based on the percentage setup at the contract level for the deal in question. These percentages at the contract level (KNetback table) are tiered. There are two methods of deriving the percentage.
	Method 0 (All or nothing) - With this method the average daily volume for the month
35	will be used to find the appropriate tier (also based on effective date). The netback percentage to use will be the FIRST tier setup on the contract whose average daily volume does not exceed the total for the gas month on this package. All gas volume for the month will use this same percentage (all or nothing).
40	Method 1 (Accumulating) - With this method the resulting end percentage that will be used is based on volumes within each tier (they are weighted based on their respective volumes. The netback percentage that is calculated is based on the wieghted average of all percentages, across all tiers using volumes that were applied.
45	This particular function will work with Nomination (WhichPricex = 0) and Actual (WhichPricex = 1) volumes. In addition, this procedure can return both 'GAS' and/or 'OIL' (and or any other) netback (via the TypeNetbackx parameter).
50	was sent as an input parameter. The WASP indicator is based on the combination of deal classifications that have been established for this deal. The default indicator is 'N' (ie if classification information can't be found/etc.). All combinations of deal classifications should be setup.
	Inputs:
55	PIDx (package ID) GasMonthx (Gas Month) TypeNetbackx (type of netback percentage) WhichPricex (0=Nominations, 1=Actuals)
60	Outputs:
	A single percentage to be applied to the price, representing the netback.
	History:

25	CREATE PROCEDURE usp_LinePrice(
	AS BEGIN **		
30	Name: usp_LinePrice		
35	Description: This procedure will calculate the line price for a specific Engine record. The input parameter nETID represents a unique key to a specific Engine record. In addition, the nNomOrAct parameter specifies whether or not to post the price line information to the nomination area or the actual area of the engine record. The volgroup field on the engine record contains the unique package (deal) id. This is used in the link to get the actual price components for the package.		
40	Inputs:		
	nETID = Engine Key nNomOrAct = (0=Nomination,1=Actualization)		
45	Outputs:		
	Either an updated PriceOrRateNom or PriceOrRateAct field on the Engine record. The precise field updated depends on the input parameter sent to this process (nNomOrAct).		
50	History:		
	xx/xx/xx (?) CHIP Original Creation.		
55 60	04/29/99 JAMIE Modified for WASP 2.10 Release. Structure changes made to the Engine and Engine_Master tables. In addition, all documentation added. This particular portion of the system required extensive changes due to the need to store a nom and actual number and because all price components are now stored off the Engine_MasterPrice table (STID's 8 and 9).		
	06/22/2000 JAMIE Modified to pull in the entity, product and service in order to get the correct price off the wasp table (values are passed to the wasp routine).		
65	11/10/2000 JAMIE Converted to Transact-SQL

60	AS BEGIN /*				

65	Description: Price all of the gas inventory items.				
	History:				
70	xx/xx/xx (?) CHIP Original Creation.				
70	xx/xx/xx (?) CHIP Original Creation.				

5	05/03/99 JAMIE Modified for WASP 2.10 Release. Structure changes made to the Engine and Engine_Master tables. In addition, all documentation added. In addition modifications were made to drive the pricing off package identifier versus Gas Inventory Transaction Identifier (TID). Since all pricing is done at a package level.
10	Only those entries within the gas inventory with pricetype=1 will be processed by this procedure. These entries represent only the purchase and sale items AND SHOULD HAVE Engine_Master records associated with them.
15	07/12/2000 JAMIE Modified to check for the actualizedflag on the gasinv record. If the flag is set to a 'Y' then set the price accordingly. If the flag is set to something other than a 'Y' (ie 'N' or null) then the price will automatically get a zero. The price or rate number for actuals will still calculate AND it is possible that some meters within a deal will set the price of the same defending the price of the pr
20	calculate (if the flag is set) while other meters on the same deal will not (if the flag is not set). The engine record is where all calculated results are stored and will contain zeros for the entries that have not been setup to be actualized.

BEGIN

	BEGIN /*				
]" ************************************				
5	Name: usp_PSPriceAll				
J	Description:				
10	Loop thruough all packages (deals) involved within a given month (purchase or sale) and invoke the price procedures.				
	Inputs:				
15	GasMonthx (Gas Month to price), DebitCreditx (0=Debit (Purchases) - 1=Credit (Sales)), WhichPricex (0=Nominations, 1=Actualizations PKGx (0=all otherwise specific package ID) EntityCIDx (owning company entity id) IncludeInWASPx (" for all, otherwise check for 'Common', 'Dedicated', or 'None')				
20	History:				
25	05/13/99 JAMIE This entire process was rewritten with V2.10 of the Gas Control System. Package driven now instead of individual inventory item driven.				
23	07/22/99 JAMIE Include 3rd party deals within the calcualtion process. They WILL NOT BE included within the WASP calculations and will be treated the same as "Dedicated" (sanctioned sales) deals. This will ensure they are not affecting any other pricing component.				
30	05/24/2000 JAMIE Modified to include the changes to calculate based on company entity ID (passed to this calculation). This ensures that WASP calculations/etc are all within their respective companies The deal cursor (PackageCursor) will now only select those items where the entity ID for the contract on the deal				
35	matches the one passed to this routine.				
40	07/26/2000 JAMIE Modified to include the IncludeInWaspx parameter to this particular procedure. This will allow certain types of deals to be priced independently of other types (ie do 3rd party first in order to divie the proceeds either to a pool OR to another deal).

10	CREATE PROCEDURE usp_PSPriceAssignInvoiceNo(@GasMonthx DATETIME		
15	AS BEGIN SET NOCOUNT ON /*		
	Name: usp_PSPriceAssignInvoiceNo		
20	Description: This routine will clear out any existing invoice numbers on the gas inventory table AND generate/assign an invoice number and post to the gas inventory table.		
25	This particular routine is only looking at 'Sales' (DBCR=1) within the specified gas month (GasMonthx) that have a price type of '1' (ie not a transport inventory item).		
	The format of the invoice number that gets generated will be as follows:		
30	Character		
35	 Represents alph code for month (A=January, B=February, etc.). Represents the last digit of the year (1999=9, 2000=0, etc.). Represents unquie number assigned. Represents 'N' for Nominations. 		
40	These invoice numbers are generated uniquely for all sales meters within a given pipe and company identifier. This procedure will assign the invoice number to both the nom and actual fields. Later (during actual calculations) the actual invoice number may or may not get updated based on the modifications made to the volumes or prices.		
	Inputs: GasMonthx (Gas Month to calculate),		
4-	History:		
45	10/27/1999 JAMIE Original creation		
50	11/19/1999 JAMIE Modified the number creation to post the final character as an 'N'.		
00	12/21/1999 JAMIE Modified the number creation process to put the monthly alphabetic code at the beginning of the invoice number instead of the 2nd character.

```

Description: This particular procedure will perform the actual calculations and post updates to the engine table (for other costs associated with deals). This is done for each meter within a deal for an other cost item.

5	Inputs:
10 15	GasMonthx (Gas Month to cost) WhichPricex (0=Nominations, 1=Actualizations) PKGx (deal id) STIDx (engine transaction id) PCIDx (deal other cost unique id (see PackageCosts table) TIDx (gas inventory identifier) CostLevelx (Level that cost is appropriated towards) CostBasisx (rules governing calculation of the cost)
15	CostRateOrAmountx (rate or amount involved in cost) TotalVolumex (total volume for deal) MeterVolumex (total volume for meter within deal).
20	History: 10/20/99 JAMIE Initial creation.
25	$03/\!26/\!00$ JAMIE Modified to allow for zero volume deals to have other (fixed) costs assigned to them.
	10/03/20 JAMIE Modified to correct problem associated with 'METER' calculations using entire deal volume.
30	12/01/2000 JAMIE Modified to apply the netback percentage to the other cost when it is calculated. This percentage is only applicable to purchase deals that are in the 'Common' or 'Dedicated' pools.
35	12/10/2000 JAMIE Modified to check for the apply netback flag on the cost record in order to determine if the netback percentage should be applied to the cost.

           Name: usp_PSPriceCreateActualEntries
           Description: This routine will clear out any existing links and pricing enties
50
           that may have already been setup for pipeline actuals. It will then copy the
           nominiation pricing and linking entries for pipeline actuals (within the given
           month). This process should only get invoked with the status of a given month
           within the gas control system goes from 'Sales' to 'Invoiced' at that point in time
           the accounting group will be responsible for any further modifications.
55
           Inputs:
           GasMonthx (Gas Month to calculate),
60
           History:
           08/04/1999 JAMIE Original creation
           08/25/2000 JAMIE Modified to remove the PackageLinks delete and build
65
           logic (replaced by new routing structures).
           70

	AS)	
	BEGIN	
45	/* ***********************************	
	Name: usp_PSPriceWaspCalc	
50	Description: This is the main process for calculating the WASP price information for a particular gas month and type of price (nom's or pipeline actuals). The end result of this process is to post updated price amounts within the engine. The WASP calculation has also been modified to perform the calculations pooled by entity (passed to this routine), within entity by product (Oil/Gas/Liguids) and service (marketing/passthrough/etc.).	
FF	Inputs:	
55	GasMonthx (Gas Month to calculate), WhichPricex (0=Nominations, 1=Actualizations) EntityCIDx (which company is being calculated (owner company))	
60	History:	
	06/22/99 JAMIE Original creation	
65	07/22/99 JAMIE Include 3rd party deals within the calcualtion process. They WILL NOT BE included within the WASP calculations and will be treated the same as "Dedicated" (sanctioned sales) deals. This will ensure they are not affecting any other pricing component.	
70	05/01/00 JAMIE Modifications to utilize the new routing structure as part of the calculation. A check is made to see if any 'routing' entries are made to the new	

	structures (for the month). If so, then this routine will invoke the new routines. Otherwise, the old routines are invoked.
5	05/24/2000 JAMIE Modifications to add the EntityCIDx component to the calculation (passed to this routine by the calling program). In addition, modifications were made to calculate all WASP pricing within each unique product and service.
	08/25/2000 JAMIE Modified to remove all of the old routing routines.

	History:	
50	05/01/2000 JAMIE Original Creation.	
55	07/20/2000 JAMIE Modified in order to capture and save resolved total amounts along with the resolved volume amounts. This was required in order to correct a calculation problem.	
	07/28/2000 JAMIE Modified to take into consideration which WASP pool is currently being resolved.	
60	12/05/2000 JAMIE Modified to ensure that the receipt amount will not be exceeded when determining the volume to use. This situation only arose when certain unresolved records were ordered a certain way (during the resolution ritual). Confusing, I know, but that is the best I can do The field zTempLeft contains this information

50	CREATE PROCEDURE usp_PSPriceWASPCalcSalesN(
55	AS BEGIN I*
60	Name: usp_PSPriceWASPCalcSalesN
65	Description: This process will build all of the meters within the WASPResolvedRouting table for all of the deals within the gas month. Only those meters that had actual transport volume will be moved. A different routine will iterate through the volumes posted here in order to calculate all of the prices.
	Inputs:
70	GasMonthx - Gas Month

	WhichPricex - 0=Nominations, 1=Actuals			
5	EntityCIDx - Entity being calculated (owning company) KProductIDx - Product type being calculated. KServiceIDx - Service type being calculated.			
5	History:			
	05/02/2000 JAMIE Original Creation.			
10	05/24/2000 JAMIE Modified to add the Entity, product and service types to be parameters to this procedure. This will ensure that gas, oil, etc amongst the various types of companies (entities) being serviced do not get in			
15	07/20/2000 JAMIE Modified in order to initialize new resolved amount fields for all records that get added to the WASPResolvedRouting table.			
20	08/18/2000 JAMIE Modified to go ahead and put the actual purchase point items on the table to include them in the calculations. At this point the WASPResolvedRouting table will contain ALL entries (see 'Type' field on the database). Purchase points thru Sales points.			
	10/03/2000 JAMIE Modified to incorporate the 'Other Cost' amount totals into the Resolved table total calculation.			
25	01/09/2000 JAMIE For consistency. Modified the rounding (on the prices to two decimal places (for all months previous to December 2000).

	Name: usp_PSPriceWASPDivieOutProceeds			
	,_			
45	Description:			
	This procedure will get executed during the WASP calculation in order			
	to credit the financial proceeds (gain or loss) from one deal to another.			
50				
50	These proceed designations are setup on the package table			
	(FinancialPKG and FinancialMID field contains either a deal id			
	or a common wasp meter pool point that is to receive the proceeds). These fields are mutually exclusive on the deal table.			
	These helds are muddally exclusive on the deal table.			
55	The default for all deals is the deal itself (for owning the proceeds). Only			
00	if the FinancialPKG or FinancialMID field has been entered will it be			
	distributed elsewhere. The distribution amount (if any) will be posted			
	on the from deal record (either in the FinancialNomAmount or			
	FinancialActAmount field, dependant on which price is calculating).			
60				
	This procedure works for 3rd party deals only (deal classification rule			
	is equal to 'None'). The reason for this is because these are the only			
	types of deals where we know the actual margin ('Common' (Wasp)			
G.E.	and sanctioned sales (Dedicated) are netback calculated deals.			
65	For all FinancialPKG/MID entries this procedure will:			
	i oi an i mandair Normio entres this procedure with			
	1. Calculate the margin (purchase price and purchase meter price).			
	Reduce the purchase meter amounts by the amount calculated.			
70	3. Post the dollar amount to the proceed purchase meter(s) based on the	eir respective		

Inputs: 5 GasMonthx - Gas Month WhichPricex - 0=Nominations, 1=Actuals EntityCiDx - owning company/entity History: 10 07/27/1999 JAMIE Original Creation. 10/13/1999 JAMIE Modified to cast the distribution amounts to decimal(18,4). This is because of bug receiving correct amount to distrubute when dividing 15 two integers. 03/30/2000 JAMIE Modified the program to not use the 'PackageLinks' table but to use the FinancialPKG field stored on the deal table. This was done as part of the integration with linking and the new route 20 05/24/2000 JAMIE Modified to include the owning company/entity. 07/28/2000 JAMIE Modified in order to post the updates of what is 25 being distributed back to the Package table (for the 'from' deal) and then post the amounts to the WASP Purchase Meter table (for deals) or WASP Legs for meters. This change was done in order to facilitate the reordering of the calculations. 08/07/2000 JAMIE Modified so that even if diving to a specific deal IF 30 that deal is a wasp deal then all deals that share the same original purchase point meters as the deal being divied to (in the 'Common' pool) will share in the divie. 35 08/18/2000 JAMIE Modified so that if diving to a specific deal then the amount will go to the WASPResolvedRouting table versus the obsolete WASPPurchaseMeterTable. ************** 40 */ * Declare all variables and cursors * that are needed by this process. 45 DECLARE @zMessage VARCHAR(254) DECLARE @zLastDay DATETIME DECLARE @zPurchasePrice DECIMAL(19,6) 50 DECLARE @zincludelnWasp VARCHAR(10) DECLARE @zTotalVolume INTEGER DECLARE @zGrandTotalDistributed DECIMAL(19,2) DECLARE @zTempVolPercent DECIMAL(19,4)

The WASPResolvedRouting table contains all of the prices for WASP purchases. 50 An attempt should first be made to see if the price can be resolved by reading for a 'Dedicated' wasp pool (sanctioned sales/purchases are more or less

on the WASPResolvedRouting.

If the specific package cannot be found then the purchase meter will be used (ie.. 'Common' wasp pool).

Inputs:

TIDx - Unique Key to gas inventory record (GasInv)
NomOrActualx - 0=Nominations, 1=Actualizations
EntityCIDx - owner
KProductIDx - product id
KServiceIDx - service
GasMonthx - Current gas month
rReturnValue - OUTPUT return value

dedicated). The purchase deal id must match the dedicated purchase pkg field

History:

```
06/29/1999 JAMIE Modified from original creation
            (date of original creation?) to support WASP calc changes V2.20.
            06/22/2000 JAMIE Modified to get wasp prices based on entity,
  5
            product, and service.
            08/18/2000 JAMIE Modified to get the wasp prices off the WASPResolvedRouting
            table versus the obsolete WASPPurchaseMeterTable.
10
            11/07/2000 JAMIE Modifications to convert from Watcom-SQL to
            Transact-SQL.

ADDITIONAL FEATURES

The present invention has been disclosed, illustrated, and described in relation to a client-server application that facilitates pricing and distribution of fuel to a customer. Although centralized data storage and manipulation is preferred in regard to the version of the system that has been provided, the inventors contemplate other applications and enhancements that certainly are within the scope of the present invention. For example, the present invention relies on data inputs and feeds from a variety of entities such as producers, transporters, etc. Although such data inputs are often entered manually into the systems provided by the present invention, such data inputs could be automatically delivered and stored within data store 106 (FIG. 2). For example, transporters controlling actual meters along a gas pipeline, for example, could be outfitted with remote sensors and transmitters that provide shipment volume, etc. details directly to the systems provided by the present invention. Moreover, data inputs such as indexing datum used to drive pricing, etc. may be similarly obtained. And, since such data inputs can come from a variety of sources,

5

10

15

20

modern communications technologies such as the Internet, wireless technologies, etc. could all be used to couple an operator of the systems and methods provided by the present invention with such sources. Accordingly, the present invention is not limited to any particular data retrieval system, topology, method, or paradigm. Those skilled in the art will be immediately able to adapt and modify the underlying data collection capabilities of the systems and methods provided by the present invention to incorporate such new and modern technologies and techniques.

Finally, it should be noted that the present invention contemplates and provides for an elaborate reporting capability as provided within the software contained on the attached compact disc. Those skilled in the art of computer programming and those familiar with fuel deal management will immediately understand that any number of report may be prepared to suit and satisfy management requirements. The database tables maintained by the present invention certainly support all types of relational type queries that such reports may require.

Thus, having fully described the present invention by way of example with reference to the attached drawing figures, it will be readily appreciated that many changes and modifications may be made to the invention and to any of the exemplary embodiments shown and/or described herein without departing from the spirit or scope of the invention which is defined in the appended claims.
